Overseas £14 for 12 issues

How to submit articles

The costs of the material we can publish in Dragon User must remain well below a great extent, depend on the quality of the manuscripts that you send us with your Dragon. The Dragon 32 cannot be easily launched on to the market with a powerful review of those that will very soon deteriorate.

Every one of us who uses a Dragon will be able to write more news and games stories every day. To have our Dragon users keep up with the speed of the development each of us must assume that we make the necessary fit — that means writing it down and passing it on to others.

Articles which are submitted to Dragon User publications should not be more than half-a-page long. All illustrations should be typed. Please leave one margin and a double space between text lines. Programs should, whenever possible, be computer printed on plain white paper and be sent enclosed in a tape or floppy disk.

When you submit an article, please enclose a copy if you would like to have your program returned; you must include at least one addressed envelope.

Please give details according to the length and the quality — it is worth making that sort of a start.

Editorial

Welcome to Dragon User — Britain's first monthly magazine devoted entirely to helping owners of Oregon computers.

It is nearly time now that we first began to hear rumours that a little known toy company was about to launch a new home computer. At the time Scratch was having problems with its Spectrum computer but was still thought it unlikely that a newcomer with no experience of the market could be able to break in. That the Dragon 32 was launched in August is just undeniably a good and powerful machine. We were all sceptical. The documentation was poor and the parent toy company seemed to be in serious financial difficulties.

Dragon Data (Management) Director Terry Clarke, has, however, managed to get various financial institutions bought and re-financed the company which enabled it to build up the production rate to come closer to meeting the unexpectedly high demand. High street retailers and dealers accepted that the machine was going to prove popular and software houses began to include Dragon 32 essential in their ranges.

Dragon owners can now look forward to a long relationship with the company. Work is being done to offer upgrades to the BASIC and the memory of the Dragon 32. New more business orientated computers are being developed so that Dragon can offer a range of computers of different capacities in different price ranges, becoming less reliant on the position vagaries of one market.

Versions of the Dragon 32 are now being sold in many parts of the world. Last summer a plant in the United States started production for the American market. On top of the 100,000 Dragons which will have been sold in Britain by Christmas we can look forward to the additional support of up to 200,000 Dragons at the US!

All this means that Dragon owners can grow with their machines, can bank on the support of any number of software and hardware companies which will in turn offer an ever growing range of add-ons and upgrades with which we can continuously improve our machines.

In Dragon User we will aim to keep you up to date with all the latest developments from Dragon, the latest software which we will test and rate, and the latest hardware. We will also, with your help and discoveries, teach how to make the most of this machine we already have.

THE DRAGON DUNGEON

DRAGON GOODIES

now that we've shifted the rack out of the torture chamber we've cleared our storage space and now stock the widest range of Oregon software available from a single UK source.

The Dungeon Master has been persuaded to expand his range little Price List and we can now pass you a descriptive catalogue with an outline of new products.

BEST-SELLING GAMES IN STOCK: Dragon Commander £14.98, The Viking Dragon £21.98, Dragon Extravaganza £14.98.

Advanced BASIC for the Dragon: £14.98.

Best selling arcade games in stock: Century 2049, Dr. Spectrum Attack £14.98, Space Invaders £7.98, Phoenix Invaders £8.98.

Best selling adventure: Forest £17.98.

Software plus book: £14.98, The Valley £14.98, Lumberjack £14.98, Oregon Trail £14.98.

Best selling utilities: Dragon Doctor £14.98 and Dragon Disk Doctor £14.98. Assistant Carpenter £14.98. Telephone Full Facility 102 System £14.98.

DRAGON STICKS!

Top quality double joysticks for the Oregon who demands arcade action. Ultra-sensitive, but tough and reliable, Dragon Sticks will keep on zapping when others fail! £19.98 per pair inclusive VAT and postage.

DRAGON OWNERS CLUB

The dragon Owners Club of the Dragon is the largest and most active club in the UK. About 1000 members worldwide and growing. What can the Dragon Owners Club do for you? The Owners Club is run by volunteers. We have a newsletter, 'The Dragon' and newsletter, 'Oz News' both packed with news. You get the latest information about new Dragon software releases. We have over 1000 Dragon owners in our 20 countries.

The best news of Dragon Owners Club is we have the best Dragon hardware and software offers. And the chance to buy the best Dragon data printer that comes with the Dragon Club members' discounts. We're on Dragon Mailbox!

Annual membership including Dragon's Guide £14.98 includes free telephone support until the year is over.

EFFECTIVE PROGRAMMING AIDS TO HELP YOU GET THE MOST FROM YOUR MICROCOMPUTER

LOGIC-PLAN LOGIC GUIDE (108 Sheets A4 - £19.98) This is the first of 11 valuable development aids it's a direct and approach to programming. A complete recommended by the BBC and in other leading Computer Books.

The sheet gives useful programming storage of each program being designed and the user referenced. Although often very large, most complex programs are developed. They can be used as an invaluable debugging aid as well as checking any newly coded programs and will prove an indispensable tool for any BBC microprogrammer with choice made of computer & language used.

GRAPHIC PLANNING PRICE:

£10.00 (Sheets A3 - 31 1/2" x 18 1/2")

The large A3 sheet allows the microprogrammer to understand his needs and produce them in a clear and effective manner. It contains all the information he needs to start work on his program, including a large area to write in notes.

GRAPHIC PLANNING GUIDE (108 Sheets A4 - £19.98) Each grid is designed for use with specified micro-computers and has been used to do the authors work in to position the results of designing high resolution graphics displays. Of all the available colour computers the BBC Micro is the most popular, so the guide is specifically designed for the BBC Micro. An ideal aid to beginner and expert alike.

Useful commands

I feel it is often unfortunate that the use of Alt+Enter may be of use to other Dragon users. When the Dragon's manual says "Print behaves in a similar way to Cover" they mean exactly the same thing — all formats and areas above are closed and areas unboxed.

(2) The Dragon's manual also points out that "As each graphics page requires additional bytes of memory, they require what is needed". Because the Amiga's own Print is located in memory at 1, I can't program over any graphics at all you will need 1000 bytes of memory in Page 1.

It is possible to overcome the printed problem. As Dragon cannot print in PCW, 7% or 2% the start and end addresses of lines are at Pages 25 to 29. So instead of using Page 1 set it direct mode. Page 25 is to move the start address to 1527 and Page 27 is to move the end address and types to the right to 1528. Now to check this type Page Page [25] = 250 + Page 125.

For the new (25) address add Page Page [27] = 250 + Page 125 for the new end address. Now you gain an extra 1.5K of memory.

The added advantage is that your program is protected. Try closing any graphics window and your Dragon will not let you. As the new command is so useful why on earth was the Dragon's basic not designed to allow Page 1

Dragon fodder

As 10 years old get into a Dragon 32 for the second recently it's a friendly little Dragon. I would like to leave it on basic software and good educational programs. The former is easily found but the latter is not that kind!

Could you through your magazine let your readers to send me for your personal details of cassette programs etc or if used the names of software houses etc

Printing in Dragon Update?

You ask at the moment I need the board by hand and I hope I have the print in the reflect eye!

Sure and

Myles Thomas (Myles Computer) Macclesfield Junior High P.S. I am sure lots of teachers will read your magazine so they would benefit from such information.

Word help needed

ENCLOSURE WITH this letter is my first year's subscription to *Dragon User*.

The article which would be of great interest to me would be a *Phrasebook Dictionary* for use with Computer Works. Personally I have found great difficulty in understanding words. It is simple as not possible to know exactly what exactly what words they have been structured and update them each month.

Storing problems...

FORTUNATO: I can help! If I can (Popular Computing January 3-15 March 1982) I had problems initially with storing programs taken from my Dragon on the floppy and ready for use on cassette recorder. I passed the problem to the cassette recorder manufacturer taking his advice to switch off running speed with the result that my 1.2K files in the programs header were not copied when trying to Cover a program. The problem was easily solved by always starting the cassette recorder manually before passing data. There was no corresponding difficulty when Covering.

The Dragon must have a delay built into its operating system to permit the cassette recorder to attain the correct speed before it begins to read data. In my case this delay is insufficient, but probably by slowing a cassette revolution it would be possible to increase the delay and ensure more time available to data regard less of the inherent motion of cassette recorder while not using the

facility to switch the cassette recorder. I would be grateful to hear of any better ideas.

For my particular set up both Covering and Covering are now totally reliable and trouble free. When trying a long program it always takes many minutes or so to cover the work done so far. This ensures that if anything does go wrong the amount of effort wasted is kept to a minimum.

S. J. Steel
Aughton
Lancashire
UK

Solved once . . .

I TOO experienced considerable difficulty in loading and saving programs from a board tape. Super cassette purchased with my Dragon 32.

I discovered after many frustrating hours that the leads were very badly connected and after my husband had checked the connections at the rear of the and recorder pads for the cassette recorder, I approached my parts supplier with my problem. A few months later the other end of both pads plug into the computer became disconnected and this had to be soldered into place. Despite this we now have no problems.

I also feel that this should not be happening and that these leads should be checked before leaving the factory. I now have a little trouble with the connection from the monitor to the computer. The plastic was not in the clamping and was causing very bad connection.

M. J. Blaizey
Brixton, PA
Cornwall

Solved twice . . .

If YOU have never saved programs and just had a hard disk option or other source with the recorder to load that I do not actually record.

By the bye, I would like to add the following: but hardly seem to have much umbrella at the Dragon's use of the 8080 and are refusing to operate. Any suggestions?

Recorder advice

DIRECT SELLING: I bought my Dragon in December 1982. I have used four different makes of cassette recorder with it and found that the best results were obtained from a domestic Revox recorder (£19.95 from Rumbelow). This is much more consistent than the Sony and Philips cassettes which I have also tried — this may be due to a feature relating to Revox which some more expert people much know. Have often experienced difficulty in prevent switching at the tape counter due to noise from tape in addition.

However, even using the Revox I can get rid of all the noise and so the following is the procedure I follow when buying a program:

- (1) Buy program
- (2) Listen to it
- (3) Run program
- (4) If there is any noise, stop and go to (5)
- (5) Put Revox on the tape and listen to the cassette recorder. If possible record the cassette on the computer. The noise will not be in the clamping and was causing very bad connection.

M. J. Blaizey
Brixton, PA
Cornwall

- (6) If (5) doesn't remove cassette change playback volume. If it is too low then 8-8-1 will give 8.0K plus change volume pads.
- (7) If the noise is successful — switch everything off and go to (8) prints.

The above procedure results in always having a education program and no noisy effort is wasted.

J. McCormick
Longley
Macclesfield

P.S. The highest volume I have had is 8-8-1-3 — at reaches a sufficiently high level to drive you (usually laughter) it may be better to change your cassette recorder.

No Dragons at Smiths

IN SMITHS has no plans as stock either the Dragon 32 or software is not on a

It seems both Smiths and Dragon are too busy to consider it.

Smiths' John Roland commented: "What exists in the market are Compaq 32 and One

an have enough in our plate already."

Dragon's Howard Westman said: "They only intended for us to implement what I got the capacity. I think it would be difficult to take on an additional retailer like the size of Smiths at this time."

Also, since Books already stocks the machine, it is not in Dragon's interest to have two high-street stores competing on price.

New factory opens

Production will reach 15,000 Dragon's a month

PRODUCTION of Dragon computers is to be stepped up now that the move to new premises is complete.

The new factory at Hartlepool near Port Talbot has a much larger floor space and will bring capacity completely in line with the site's initial capacity.

Dragon is now manufacturing just under 5,000 machines a month.

The move went very smoothly and over the next couple of months we shall be moving all our production to 10,000 units a week," commented Dragon's Tony Clark.

However, it will take some

time for production to exceed demand.

Dragon 32 machines were in very short supply immediately prior to Christmas and all of Dragon's outlets — including the Books stores — are still receiving a restricted allocation.

Always when you get a great many orders there is a temptation to throw everything you can lay off the door unanswerable (Books). But that is counterproductive.

All our machines are assembled and we have had to adopt a strict allocation system for all of the Dragon's outlets.

More micros to follow memory

HAVING sold over 50,000 Dragon 32 machines, Dragon Data plans a formidable hardware expansion in 1983.

This come the discs planned for late this year and April. A single-disc system with interface and disc operating sys tem will cost £295.

The package uses a flat height disc with a transfer rate of single-density 48 tracks per inch, servo with a capacity of 1000 formatted 16KB sectors.

Dragon Data is also launching the new 550 disc operating system (around £400) and Basic OS, Pascal and Version TG compilers (all around £400) from Microsoft in the UK.

These will be available in the middle of May at the same time as the expansion kit.

giving the Dragon 64K RAM. This add-on may include one 80286 microprocessor (not included) and should cost around £220.

An 80-column card (quad-density only) is in the final stages of development and should be available.

Software to run the seven new range of business packages is available under C64. C650 is also planned — no date with programs under £300 is given.

Dragon Data also plans two completely new machines for launch later in the year.

The first will sell for around £4200 and be a competitor for the BBC Model B; the second will be a full power business system aimed at the IBM PC-clone market.

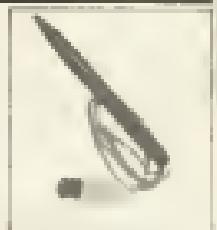

Trojan lets out light

TROJAN Products is now outlining a light pen for the Dragon 32.

This unit costs £15 and is supplied complete with a cassette giving full instructions and examples showing how to incorporate the input from the pen into a program.

The light pen plugs into the joystick port on the Dragon and is addressable from the keyboard.

It can be used to input any co-ordinates data from the screen and a resolution enough

to plug into the joystick port. In action it is used in car simulation games.

More information from Trojan Products, 166 Design Court, Dagenham, Essex.

Users get options on assemblers

SUDDENLY there is a reasonable choice of assemblers available for the Dragon.

Dragon staff has two variants on the way — one on cassette and one on ROM. Other passages are available from Computerware and J. M. Clark (Micro).

The two Dragon Data offer tape and assembler writers with a de-bug facility. The cassette-based version priced at around £150 is the simpler.

The cartridge version with

more power with more extensive de-bug capabilities and will be priced around £40.

Computerware's assembler is a different sort of package — it is what is called an in-line assembler. Rather than being basic, integrated, the user hardly does not understand the basic.

Instead it adds extra commands which allow the assembly language to be added to an existing Basic program. When the assembler

partitions of code are executed in BASIC through the Basic program, putting out and compiling this code.

The beauty of the package is explained in Computerware's spokesman's words: "The code is embedded in the Basic. That way there is no need for assembly. The editor is already there in the Basic."

The Computerware Dragon assembler is available from PO Box 169 Petersfield, Hants GU12 4LZ, price £19.95.

Finally there is the editor assembler from J. M. Clark (Micro). Converted from a 6800 system developed for the Z80/Tech machine, this is a two-pass assembler which functions independently of the Dragon's RAM.

The package includes an application (in cassette) and a machine code monitor. It is supplied in cassette form and costs £27.95. More details from J. M. Clark (Micro), 2 Oldspital Street, Luton.

Dragon 32 goes west

Dragon Data's Tony Clark

THE DRAGON 32 machine will be launched in the US this year.

Three American companies are currently in discussion with Dragon Data with a view to manufacturing the machine in the US.

Hitherto has been trailed just," said Dragon managing director Tony Clark. "Whatever happens it will be there sooner or later. It has to accommodate reasons as a joint venture with a US company."

TAPES schemes written for the Tandy Colour Computer can be loaded directly into the Dragon 32 using a new cartridge from Compuware.

Both machines run the same version of Microsoft BASIC and have similar hardware. This means that a program loaded directly into either machine will run.

However because of differences in the input/output routines when a Tandy program is loaded into the Dragon from tape certain of the basic keywords are misinterpreted.

Within the machine each keyword — such as GOSUB or END — is represented by what is called a token. The problem of software compatibility is that in some cases the same token is used to represent different keywords on the different machines.

The Compuware Decode cartridge simply goes through

the Tandy program after it is loaded and makes the necessary corrections to the tokens so that a will run properly.

First the Decode cartridge is plugged into the Dragon. Normally the usual warning message about input but the Decode program itself has been specially adapted so that this does not happen.

Then the Tandy program required for conversion is loaded from tape in the normal manner.

Finally the Decode program is run by typing in the command EXCD 32C000.

When the translation is complete the program now in Dragon 32 format will be saved to tape.

The cartridge will successfully convert almost any program written for the Tandy Colour computer in Extended Microsoft Basic. The Decode program has been designed

so that it ignores the content of strings.

Machine code held in subroutines — used to set up the graphics for example — is not affected by the Decode program. Machine-code routines will work equally on both machines without any adaptions.

The only possible problem could come if someone has taken part of the Tandy Rom in a program without using one of the standard machine-code entry points," explained Compuware's Ted Goycolea. "In practice international software houses tend not to do this on the Tandy Rom."

He originally developed the Decode program for ourselves and we still use it on a commercial basis.

Decode costs £19.95 and is available from Compuware, P.O. Box 168, Palmers Green, London N13.

News Desk

01-838 2478

DRAGON'S software houses have announced three new titles for the Dragon. These are Starlight, a space-age-style space-type game; Super Hangman featuring high-resolution graphics and a 10,000-word vocabulary; and Sketchpad, a graphics package. More details from Salamander, 17 Abberley Road, Brighton.

Package additions on the way

In 1983, Real Time Dragon will launch a substantial catalogue of new software titles.

We are just finalising agreements for 26 new programs, said Dragon's software development manager, Paul Hobbs.

First comes Real Puzzler, a freeware type game, followed

by D'Orbello, an adventure game set in the classic Whity Card Plan and Smart Treasure.

Computer Voice is a speech synthesiser using string arrays to build up phonetic codes. These can be used like building blocks to make up simple sentences which can be interpreted into programs.

Dragon also plans a series of 10 educational programs aimed at the 4-12 age range. The first two titles in the Young Learning Series — dealing with numeracy and literacy — will be available very soon. Four more titles in the series are on the way.

Tandy UK puts Dragon at ease

TANDY has denied claims that it is planning legal action against Dragon Data because of the similarity of the Dragon 32 to the Tandy Colour Computer.

We have absolutely no objection to the Dragon machine, said Tandy's UK marketing director, John Sager. "We do not have any copyright on our computer in the UK."

It is true that the two machines are similar in a lot of respects — they use the same or very similar ROM pack, for example — but I can tell you categorically that we are not planning any legal action.

Besides by the time these things are sorted out all court

the machine is often out of date," he added.

Because both machines license the same version of Microsoft Basic and use the same processor, some software for the Tandy is directly applicable to the Dragon.

Interestingly, British soft ware houses are bidding to the US for Tandy material which may easily convert for the Dragon. For example, Microdata is selling material by Tom-Mix originally developed for the Tandy. The same is true of CompuSoft.

Tim O'Byrne of CompuSoft commented: "In increasingly the market is moving to produce standard soft ware for British machines."

£19.95 inc P&P

SUBMARINE COMMAND

Take a nuclear submarine (it's not like you)潜入 the Arctic. Scan the ocean's currents and sink the ships - but beware - there's something lurking!

Great new game especially set up for Dragon 32. Full colour graphics in Machine Code. £17.95 inc P&P

FEATURES INCLUDE:

- Animated map and cover screen
- View the ocean through the periscope
- Comprehensive and humungous torpedo
- Six submarine classes
- The enemy uses surface warships and aircraft against you
- Full status report
- Full range of underground instant on areas

MASTER CARDS PLAYER

Highly acclaimed and one of two of the most popular card games POWER and PONTOON

Each program uses high resolution colour graphics. Buff or be Bluffed! £19.95 inc P&P

Each month we write about one particular club — if you think yours should be featured then write to Clubs Page, Dragon User, Hollinshead Court, 11 Whitchurch Street, London WC2H 7PR.

Clubs

YOU WOULD THINK that being on the committee of two local computer clubs as well as having a full time job that involves two or three evenings a week plus doing an evening class at computer programme may sound like enough for anyone. However it was when I first approached Doug Barnes with the germ of an idea about starting a Dragon users group he was immediately keen. As a local magistrate I also have plenty of leisure time so the decision to form the Dragon Independent Owners Association was not taken lightly.

Part of our initial discussion came from Dragon Data's viewpoint. As you are basically unpacking your brand new Dragon expect no support in its year of existence and perform thousands of programmes in a small white card format to fit them. A few hours later realising that you really did need to read the manual you set back to take stock and come up with a plan again.

Part of the task is the usual questionnaire. Another part involves the new owner to fill in the printed form and become a member of the Dragon Data Club. Dragon is open user usage. Unfortunately at the time of writing that is the last you will hear of the club.

Now many brand new computers are being packed in finally losing their wrappings that there are concerns they could turn to? Of course many hardware dealers are very good. They must be very patient hearing over and over again the same procedure which questions find us. They arrive! The negotiations of whatever machine they are the proud owners of.

So it was in the light of thoughts such as these that the page 4 was compiled. We had considered a local group. A quick survey of two schools to which we have moved, I turned up a dozen or so 2001s to three or four Spectrums and odd Vicars here and just three Dragons. On the face of it therefore a local group was a non-starter. So we decided to look for plagues and began making enquiries to try to gauge the interest both among owners and within the microcomputing software industry.

A local business advertisement brought around 80 requests for information. Within two weeks this had risen to well over 100. It was clear that the need was there. Many of these requests were accompanied by long letters detailing usage that owners had come up squared mostly with tape recorders and many complaining about the Dragon manual.

The first step was to contact software houses as we felt that we should offer members more than just a shoulder to cry on. The response to our requests for a discount for members was amazing. Within a few days we received not only many offers offering discounted software but also copies of the software for us to evaluate and eventually review in our newsletters.

A visit to the bank furnished us with much needed financial advice. Though of course some initial seed money to start an association such as ours, the manager

Doug Barnes (left) and Dave Windle (right)

Two-man band in full flow

Dave Windle gives a personal account of the pleasures and problems of setting up a users' group

was most helpful in pointing out some of the pitfalls inherent across our path.

The next problem was one enquiry pointed out, was one of politics. We were not sure about the editorial group run by five people rather than by a committee of members. This is of course a very valid point. However it is a decision and any editor — how do you form a committee without having any members in the first place? We discussed this and I feel we would like it open ourselves to make the decisions and initially at least finance the venture.

Much justified in noting a few pounds on author advertising for members. Our first shock came with the first professionally printed work that we had done. Having designed them ourselves, we were surprised at the cost of our illustration sheets which was more than £20.00. We explained about it. I guess I am off price as had too good quality graphic pens and fleecy membership could have to wait.

I also feared that our newsletter would have to be less sophisticated rather than printed. However we hoped inventors could be more interested in what we could actually do for them than how shiny the paper and in fact this seems to be the case. Our newsletter, The Dragon's Tail is as yet only one issue old. The first edition was of necessity quite simple. A short editorial, a few reviews, local details of our discount scheme and a list of software houses listed around the four pages.

We were pleasantly surprised at the

reaction of members who wrote and even graduated us on the newsletter. This was followed by a letter from one of the software houses involved in our scheme which also was most encouraging.

To be absolutely honest, we were not appointed but after the right of enquiry the numbers joining as indicated rather than passed in but I feel inside thoroughly continues. On reflection how we would have coped with say 200 members overnight is difficult to imagine. At present houses work well we hope a website system set up and most enquiries are dealt with within two to three days. New members should get a letter of receipt of subscription within the same period of time.

Eventually we hope that it will be possible to form a committee as referred to earlier. The problems of doing so will soon arise — the biggest of these being that members live all over the country and in one case overseas. So a protocol has evolved as split between Doug and myself.

Doug is our PR man and also our supplies officer. He was contacted when he received a large envelope recently addressed to "The Marketing Director". He also has the task of contacting software houses and is responsible for keeping the price which we pay on somebody's toes. Once full of enthusiasm, we failed to receive properly a reply from one of the biggest software houses and involved it in our voucher scheme — which was not quite what it had agreed to. However it does mean the firm is very keen with us and in fact under a different arrangement has offered our members a larger discount than before.

My job or jobs are those of managing secretary and editor of the newsletter. I must admit I am finding it most enjoyable going through the letters, as well as very informative.

The final newsletter had a lot of one-man band as far as editors go but I am sure that this is going to change. With subsequent issues the aim is to get our members to do. The Dragon's Tail as a discussion platform and in my mind at least, it is the most important aspect of our Dragon group.

Already the letters we have received throughout the whole of micro land are some very active and bright minds.

We hope the Dragon Independent Owners Association will be able to do a lot more for the Dragon owner. We have to accept that we must leave to walk before we can run. The days when anyone who has anything to do with computers will be an electronics engineer are gone. Many of us ordinary but interested people have taken up the majority of owners. This can help however for education we are in our new hobby and that is why the QMAG was started. It is to help other Dragon owners by sharing knowledge and information and by providing a platform for discussion on the many aspects of using the Dragon.

Further details of the group can be obtained by sending a self-addressed (stamped) envelope to: DIOA, Sunbeam House, Faversham Road, Margate, Kent.

Software round-up

Fighting Samurais and spaceships, manipulating databases and synthesising speech—John Sculley finds software that will push the Dragon to its limits once arcade games have had their fill

WHEN THE CHAOS appeared last summer I was encouraged to try the Dragon Data with launching software at the same time. All too often manufacturers produce good hardware but neglect the software side, forgetting that add-ons that are used with games potential will not be bought unless the games are available. Indeed computers sell for a large degree as the software support available. Whereas early days there were programs have become available and it is interesting to see what progress has been made since then.

Software for the Dragon is available in two forms—PROM cartridges that plug into the game and databases that have to be loaded via a cassette player. The material available on cartridge consists mainly of arcade type games. As they are written in machine code they are fast and some incorporate sound effects but those them more fun than the graphics.

When you purchase any software check up to see if you need polyphonic. The packaging does not always make this clear and they are often expensive. There are several models on the market of varying quality and price so if you have not yet acquired a unit it is wise to shop around.

Dragon's own

First of all the Dragon Data cartridges. Metropolis is a version of Asteroids with a few improvements over similar games. It is possible to reach the next level from 0 to 10. It is also possible to use 1:1 or even no polyphony. Controlling the smart spaceship is fairly difficult until you realise that Metropolis likes to gravity with respect rather well and likes this sort of account. Once you learn to cope with this it is a lot of fun.

The object is to destroy as many meteors as possible before you hit one of the flying saucers which are too accurate for comfort. Individual and team scores are shown in a unique table. Unfortunately the display is in black and white in order to use the highest resolution but this is inherent in the machine and a problem that occurs in many games.

Cosmic Invaders is a rather weak version of the old Invader Space Invaders and is somewhat lacking in sparkle. Any one who has played the original would soon tire of this cartridge. It is easily beaten and once you discover how to beat

it even the prospect of a high score fails to excite.

Space Invaders can be played by one or two players and involves destroying robots by shooting your own craft with them. The interesting difference is that crafts are colour-coded according to whether they are made of metal or wood. If your craft has the 'fire' button on the joystick then you will explode. His missiles that are smart as home in on you add to the challenge of the game. Six levels from 1 to 5 may be selected and the scores are shown on the screen.

My one criticism of this game is that the background colour is the whole green the Dragon produces and with all the high-speed movement it is quite you could end up the same colour. On a more serious level this is more original than Cosmic Invaders, and to my mind offers much more fun than the congress.

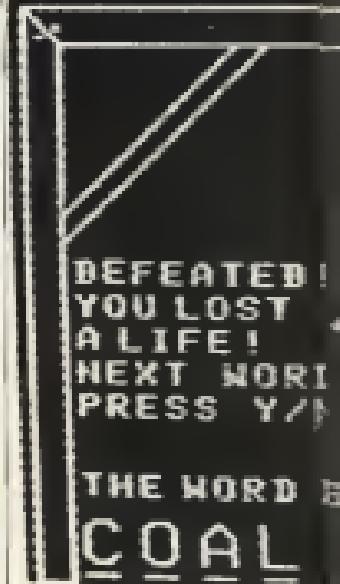

There are two cartridges that involve shooting round rings, although Dragon Data has avoided calling either of them 'Tetris'.

Cave Raiders presents you with a mine that always starts with four bars of gold in it. You must collect all the gold to collect them one at a time and decompress them just outside the entrance. Holding could be that simple, however—lurking in the cave are unpleasant creatures who devour you when they catch up with you unless you've recently passed over a power pack, when you have a few seconds to turn the tables on them. This game is fast-moving, interesting and more difficult than it at first appears.

Ship Attack is rather more familiar at dragon. The object here is to gobble up proton puffs leaving a maze while avoiding the extensions of three ghosts (systems you've recently passed over as "engines"). There are three levels of difficulty—"easy", "hard" and "uff". This game is fun to play but for serious professional fun is more expensive than the other cartridges.

Monsters is the last of the Dragon Data cartridges is based on a popular arcade game but is not often translated to the home computer format. This is another game where colour has had to be sacrificed for high resolution. You control a small man who must be steered through a series of inter-connecting rooms. Robots inhabit the rooms and you have to shoot

SUPER SKILL HAN

potato in your hands—a timer ticks away the time before they zap you. The walls are electrified so are the robots so blindingly bright they're invincible.

As you move off the edge of the screen another series of rooms appears. It is important to note the strength of a lethal boomerang ball called "Bolt". It cannot be destroyed and tends to move faster than you can. This is a well-written game and makes good use of the graphics of the Dragon.

The packages from Dragon Data cover a wide range of interests and demonstrate the many possible uses for a home computer when superb games like that still. They are refreshingly cheaper than cartridges, but naturally take much longer to load and leave you at the mercy of a sometimes unfriendly operating system. If you've used your Dragon for some time then you've probably discovered that once the correct level has been set you have no trouble with your own creativity but I must reiterate that machines can be temperamental.

Special Selection I contains four simple games that use the ports that arcade games do not need, namely memory and individual ports rather than well co-ordinated hand-eye movements. Each selects two characters from the keyboard

THEODORE

SKILL

seconds at a try to eat a tomatoe

and give you clues as you attempt to guess them. This is a version of Connect Four which is based on a larger version of noughts and crosses. Tomatoe is a gambling game in which the computer chooses a — 10% sure — steady dance of the familiar column sound memory game. This tape is good value and even invites you to let the program do its job to discover how the various effects are achieved. No book is used to learn more about the workings of your Dragon.

Graphic Animator uses joysticks to design shapes and pictures on the screen. There is an option to save several pages of graphics and to link them through quickly to produce an animated effect. This is an interesting cassette, but needs precise control of the movements.

Personal Finance contains three home management programs: Family Budget, Family Accounts, and Family Address. The names are self explanatory and the programs utilize the excellent file handling capabilities of the Dragon Drive; the main program is in memory, whereas files can be selected, copied, changed, deleted and new versions stored for later use. The documentation is as with all Oregon Data software, in clear and well-written and its logic is good value if you want to

explore the various sides of your Dragon. Second Selection II also uses the system to manipulate a database. This program is better than some costing tools as much — even political considering the other programs. It allows you to tell us your own database and to put the entries in order, not just in the first half but in all the others. This means that if you used the system to store names, addresses, and telephone numbers, you could sort the info alphabetical order of names or addresses, or even in the order of the phone numbers.

Of the other programs, Music uses the screen as a sheet of manuscript upon which notes may be written. The tune can be played after completion and stored on tape if you link your cassette with a tape Eurotron song writer. The version of Hangman is extremely fast — guessing a large Oregon is no real fun for the guessed!

Computerize is very good value. It allows you to input speech from your keyboard. This has to be entered carefully using parentheses or sound blocks. If you enter the words as they are spelt, the result is awful but if you experiment with the instruction book it is quite simple to make your Dragon offer a translat-

er word of choice during a game. Computer phrases are possible but I confess it was two days work before I said "Hello this is a planet and I end up here". The quality could not be considered anything more than satisfactory. But as an amateur BBC speech synthesizer it has to be good value.

Quest is a cross between Adventure and Kingdom. The aim is simple — to invent a plan of unpleasant country and invade Moorcock's Castle. Achieving this aim is considerably more difficult. You need to equip yourself at various markets with men and tools as your progress is slowly revealed on a map of the terrain. My verdict is interesting — but untrue.

Maze and the Minotaur is in the usual of traditional level adventures. The challenge is to seek treasures in a labyrinth of passages and bring it to the surface. Inventing the many rooms are both friendly and unfriendly creatures. Exploring the many labyrinths and learning the different spells is a time-consuming business but if you enjoy this sort of game you will not be disappointed with this version.

To the limits

There are now many items apart from Oregon itself which are offering software. In some cases it is not of a particularly high standard — in others it pushes the Dragon almost to its limits. There appears to be more cassettes on the market than ever before, so this is where I shall concentrate.

Gamed Compendium from Salamander Software contains six games. Courtesy Garter is similar in concept to Empire on a premium Oregon Data cassette but has more interesting graphics. If you liked Tally, it lets them with its load in the net! The game also allowed me to win much more than in real life. The racing game King dom is a management simulation of ruling a country. I did not get on as well as on the BBC demonstration tape version, but that probably says more about my skill in governing than the quality of the program.

Blackout is the American form of Monopoly, a card game where you try to get a hand worth 21 points. The graphics are reasonable and the game seems fair if I didn't feel the computer cheated all the time. Hunt the Wumpus is such an old computer game it probably has its origins in tape-driven machines. You need to explore a cave system, seeking that strange animal the Wumpus. The computer will tell you if you are getting close. If you may be asked,君子。和。The cavern has regular 11x11x11 rooms, so you may get the wumpus in the second, if you stumble into his cage you are eaten — and mauled! Not as addictive as an adventure game, but still a pleasant diversion.

The compendium also contains Noughts and Crosses and Lure Leader (space invaders). Although no new fromers are offered, the cassette is competently and reasonably documented and nicely designed. As with all Salamander software the cassette comes in a little library case similar to a video cassette holder. ■

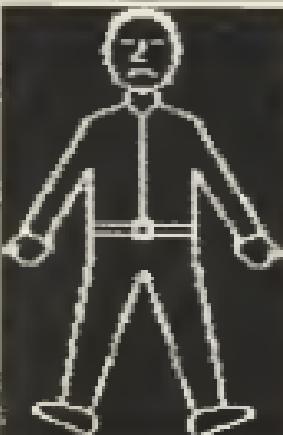

• For a selection of games it is good. Another offering from Belamender is *Cast*. The simulation is as close as the Dragon will allow and includes such features as choice of odds and strength of shot. The player is shown on a path with the various houses colour coded so as to help in choosing options. Just to help the atmosphere (and protect your nerves) there are additional bits of safety such as barriers, trees, wind velocity and direction that tend to interfere with your game.

The graphics are adequate and the version compares well with others on the market I think. I just prefer the authors version but Belamender's version would do well on many days. (I still miss the animation here.)

Hunger is one of those parameters that is easy to adapt for the computer and that indicates houses where they can't think of anything better to do — at least usually.

Superkingsmen from Belamender seems to have had some thought and effort put into it. There are three skill levels depending on how much help you want and a vocabulary which would be easily exhausted (the computer has a thousand words stored in its memory).

More than that the High resolution menu which depends on your skill is convincingly done and a decent title page the last seconds of his life as you try to win him is impressive. All in all, if you haven't got it already this looks to be the version to go for.

MC Lofstrom produces a game called *Samurai Warlord*. This is similar to King of Kings, but in a game where various choices are available to you, and the outcome depends partly on your choice and partly on luck. The location is old Japan and you are leading a band of Samurais hoping to achieve a good score. This can be achieved through fighting other Samurais, defending helpless villages, or by collecting

trophy. *Sappuku* (the Japanese word for ritual self sacrifice).

Although the concept is a nice one, the game is interesting and well thought out. There are some graphics — Samurais versus bandits, for example, but I find no actioning as in *Kung-fu Master*. I enjoyed the beauty of the game, however, and it certainly made a pleasant change from most of the dull settings of most games.

It is fairly clear to anyone entering a store like W H Smiths that the quality of computer packaging is improving all the time. Although this is pleasing to the eye, the contents do not always live up to the expectations conjured up by the superb artwork. It is also true that some software programs stop by unnoticed when they are concealed in simple boxes.

Microcon is a case in point. Some of its software is attractively packaged, but proves disappointing when the lead theory concerns originality. *Alacard* II shows a tug-of-war match in Microcon on the cover, but in order to reach this stage you must negotiate prison guards and lasers. This sounds quite involving until you realise that the game uses low-resolution graphics and being eaten in Microcon does not have the speed of a machine-code program.

The concept of the game is interesting but the result is merely average. From the spelling and the fact that the instructions are in short separate programs, it seems possible that *Alacard* II was designed for use with the Tandy Colour Computer.

• has a gaudy sleeve. This time, the book can be judged from its cover as the game is a competent version of Defender complete with smart bombs and high-speed machine-code action. The assets are rather obviously in that cartoon style, rather than small people are being shot from the surface of the planet. All the rest of the game should satisfy any Defender addict who wishes to play at home. The game originates in the United States according to the copyright information.

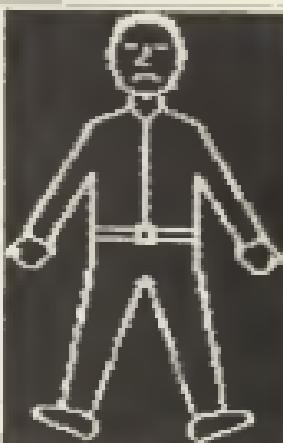

Intended as Leisureware Adventure it comes in a rather plain cover but inside looks an interesting adventure. The locations look from Arctic wastes to jungle with remarkable rapidity, but the program was written by someone with a sense of humour and is responsible for a strategy game. It is written in Basic, but this is fast enough for this type of program. My only serious quibble would be with the atrocious spelling — I counted eight mistakes in the instructions alone ("Obstacles" being one of the more amusing). This is a highly unusual for a finished product and speaks an original game.

Donkey Kong is the last from Microprose and is a "Dragonsoft" version of an American original written for the Tandy by Tom Mc. The cassette contains not one but three versions of the arcade game whose name differs only in one case. Thus though the only difference is that of the background/background colour, but if you choose black and white the sound is noticeably higher.

When it comes to reviewing strategy games, copies the main criterion must be "How good is this version?" This one lacks the rugged graphics I had strongly asked for but does have the bells and a thoroughly convincing why/why.

Computer as a practice option I failed to notice the first and was regularly crushed in battles by demons and/or Indians. Written in machine code, the game is fast enough to be addictive and I found that one formulation I chose was quickly followed by another as my trigger acted against my better judgement instead of another go.

Fordland City is an adventure game from Apes Trading of Brighton. The object as always is to amass as much money as possible without telling foul of the unashamed thuggs that lurk within the walls

of a city. An adventure game for it was not particularly engrossing. It is purely visual which means that the descriptions have to be imaging, unusual or original and here they are barely acceptable. It is fun to play but not really in the adventure class.

Cassette Two is the disappointing lot of a collection of games from Valley Pictures. The first shows is in good value in that it contains an Infidy as well as six programs. They are, however, very short and the graphics are the lowest possible. With the potential of the Dragon for excellent displays, one wonders why programs should be produced using such archaic representation methods. This gives the games the feel of something written for the ZX81. Luckily, the programs improve slightly towards the end of the cassette. Although they are basic idea, poor input users could write comparable games — so why buy this cassette?

Carried Away from Gary Software contains four games. This collection is far more varied than the last and is far better value. The first game is a flight simulator that enables you to attempt a landing provided you have a pair of joystick "A" keys. In the programme word as it is not

an easy task. There are no graphics and the interface is rudimentary, but it is unusual to find so challenging a game amongst a collection.

Hunger is the second program in a reasonable version with the words added in data lines so the program could be altered to contain your own words in a microprocessor at home. This is a lot better than the Dragon Data version. The third game is Space Speed Boat, the player of which is to ride about in their floating batcave, nothing out of the ordinary but quite interesting.

Space the last title part is a unusual co-ordinate guessing game battle ship. You have to discover the position of the computer's hidden ships and if you are successful there is a display of all the unfortunate ship being hit. My criticism of this game is that the co-ordinates have their origin in the top left-hand corner and the x value has to be entered before the y coordinate which goes against the accepted conventions. Again from Gary it is an exciting game and completed I hope will recommend good entertainment.

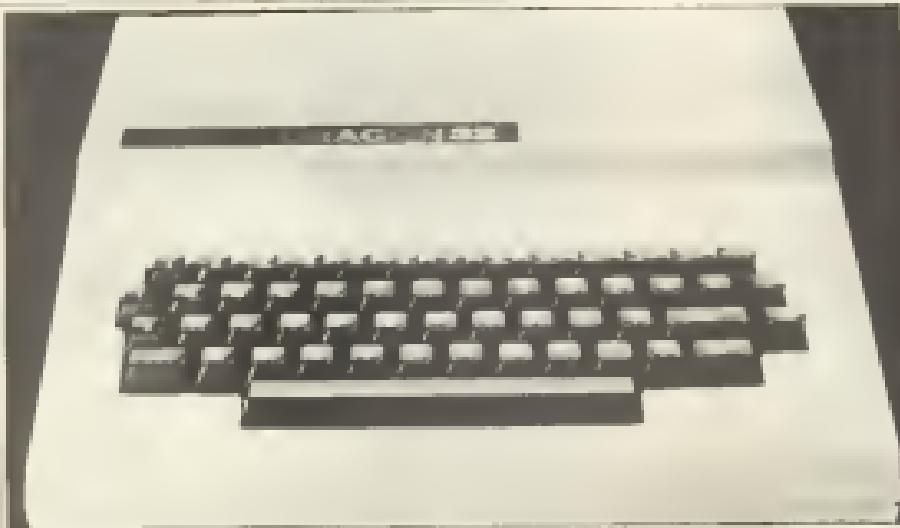

To complete this edition there is a financial cassette from Hilton Personal Computer Services — Personal Banking System. This cassette systems through functions to allow you to check on your bank (bank account), to manufacture and cash support statements etc. It copes with standing orders and corrections to entries as well as printing statements which you can compare with the bank's.

It should be used by a small business to check household accounts but this might be risky — I managed to crash the program twice by entering values outside the permissible range. A program with any business potential would not have allowed me to do this.

To sum up, it seems that there is still room for innovative software on the Dragon. Six months ago Dragon Data released its first batch of programs, and this is still able to hold its head up in the software market place. Of the cassettes and cartridges reviewed here, there seems to be a tendency towards over-charging for products that rarely rise above mediocrity. If the quality of software is not improved more people will tell their own "Ultimate" software. That would not be a bad thing.

The Dragon is one of a new breed of computer designed to run a long time, making it ideal for serious use as well as games

And in the red corner, we have the Dragon

For some people there is always that nagging doubt: *Did I buy the right machine?* Or, as is more often the case, *was I given the right machine?* **Ergis Allan** reviews popular home computers

IT IS NEVER possible to buy the best computer because such a machine does not exist; cannot exist. The answer is to the question, Is the Dragon (or its 16-bit competitor) as well as equally informative? The answer is, "Perhaps, it all depends."

There are quite a number of computers in this race to produce a cheap versatile microcomputer, and as it is difficult to evaluate any computer in a vacuum, I will try to see how the Dragon 32 compares with three other basic computers.

The three computers I have chosen to compare to the Dragon are the ZX Spectrum, the Commodore VIC-20, and the Acorn BBC Computer and they have been chosen to exemplify different styles of computing, and different philosophies of design.

A computer can be designed down to a price, that is, the manufacturer puts out with a price and then builds a machine which can be sold profitably at that price. The Sinclair machines are examples of this "sell to a price" philosophy. It is obvious that the prices of £165 and £175 were fixed well in advance of the machine, before it was built, because that was what it was left that the market could stand.

Another example of the price-dominant

mentality of Sinclair machines is the C64 compact disc promised when the Spectrum was launched. The disc has not yet been launched (you do not even know if it is a disc) but it was anticipated at £20 — though the data is now going to have a device to attach it to the Spectrum at some extra cost. The disc price has remained constant, the price of attaching (and therefore using) the disc seems to be increasing.

The Spectrum was also sold on tape in trial order only, and this again, showed the "money-stake" mentality. There are no retail, Freespace and one-store (over) about long waits for the Spectrum, and advertisements (very punctual) offering the Spectrum within 28 days when many people ascertain that there were no Spectrums in production.

The BBC computer is, unfortunately, sold with the same brutal sales by mail order, with no machines to support the advertisements. Though in the case of the BBC there was a few in specialist shops, I say. Unfortunately, because the BBC computer was built to a specification and not really to a price.

The association of the BBC computer is very good, and shows the influence of the account on the specification being given

to them in respect of the cheapness of the computer — though it is an unknown manufacturer who ignores the importance of price. It is also an unknown manufacturer who ignores the specification to concentrate totally on price.

If a manufacturer is willing to take money on the basis of a profit for the future, we should be wary.

The Vic 20 was never sold by mail order. It was sold at first in specialist shops, which Commodore agents, and later in less specialist shops in the High Street. By the time it was introduced into the UK, the Vic had been on sale in other countries, and the Vic price reflected to the general lack of bags when it was first imported.

The Vic was the first low price colour microcomputer of any importance, and when it was introduced in 1981, it was priced at about £300. This price seems to be quite a high price and — as the profit margins on computers seem to be rather high — when the Spectrum came along to undercut the Vic, the Vic's price had to be discounted to halve the price of the ZX81.

How does this compare to the history of the Dragon? The Dragon was notable for being one of the first of the never cheap of computers not to often used for serious

before its disappearance as "available within 20 days" by mail order. (The Vic was probably the first.)

The Dragon was released only in shops and in quantity; the Dragon appeared in many non-specialist outlets, but to achieve a present back-up it is still necessary to try to get a Dragon from a specialist store.

The BBC and Spectrum are similar in that both relied on postal sales, and the Spectrum is notable for helping upon mail order requests. Depending upon the mail, as they do, might explain why both (Sanger and Adam) have as some form of correspondence. The Vic, Dragon, and BBC can all be repaired in house by specialised engineers whereas the Spectrum is a Sinclair problem.

Like Vic and Dragon are not supplied by specialised retailers, then they too have to be third party — sometimes the same is true of the BBC.

Different philosophies

I have spent some time on the boring subject of support and sales technique because quite often such things end up being very important support and the way the computer is sold tends to give valuable clues about the nature of the computer's manufacturer.

The philosophy behind each computer is made obvious in many different little ways. The type of keyboard, the container which holds the computer, the type of language, the potential for expansion, and other minor considerations.

Once we start looking at these characteristics we can begin to learn about the Dragon what it can do, why it can do it, what it is capable of doing.

Start with how a user will approach each of these machines: which of these machines will be most user friendly at the start, especially for a total novice? The answer has to be without doubt, the Sinclair.

The most important consideration in the design of the Spectrum (apart from being cheap) would seem to be the total ease of use. The Spectrum has a form of logic which is easy to learn and does not require the ability to spell, because it uses keywords (one key only is used to produce Print).

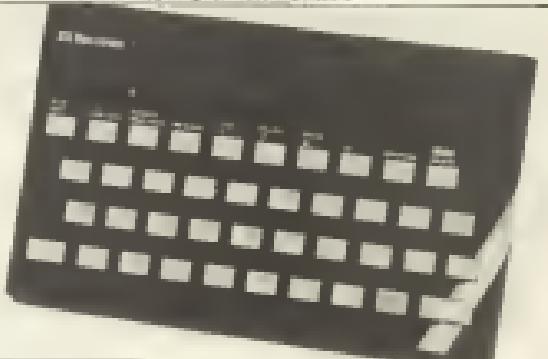

The Basic has simple graphics commands which make graphical appearing figures able to be drawn with ease (bearing in mind only green and blue colour).

A computer which is very easy to use is marketed as not always accomplish which is why I say when one wants more demanding things. All the three other computers have proper keyboards though at the outset it might be more difficult to remember how to spell Print (particular on the Dragon colour is used). Colour ultimately it will be found that computers are very restrictive, and that the sticky keyboard-free keyboard on the Spectrum is a pain.

If a computer is designed to be easily assembled then it need have a moving keyboard and not have to depend on plastic supports to produce proper keyboards. An equally has given out of the delicateness

The BBC Model computers upgrading from Model A to Model B

The Sinclair Spectrum has the advantage in respect of extension of the Z80 and Spectrum. Of the three proper keyboard philosophies I have found that the alien keyboard is that on the Vic; though here of the three is poor.

When we move to the languages available on the machines, at one end is the Spectrum and Vic, and at the other end is the BBC and the Dragon. Though the Spectrum (like the BBC and Dragon) has special graphics commands, the language is an entirely limited and the BBC (though a colour computer) does not have in-built high resolution commands — though by buying a special card pack it is possible to add such commands to the language.

With the Spectrum it is almost impossible to add new commands, partly because of the extreme dependence on Sinclair Basic upon the use of keywords.

Both the BBC and the Dragon use extended Basic and the languages have potential for expansion. The Dragon's extended Basic is not as powerful as the BBC Basic developed by Acorn but given the content of most of the books published so far about the BBC computer the power of the BBC Basic has not been really tested or used.

Where some of the tasks on program-

ming for the Spectrum and Vic are pushing the use of their Basic to the limit. In the case of BBC and Dragon books, the potential is still dormant. As the BBC and the Dragon are both more complex machines, the manufacturers themselves are probably not aware of the full potential of their own machines.

As the Spectrum and Vic are inherently simpler machines it is far simpler to cover a larger area of knowledge about them; this is partly why the manual for the Spectrum is so much more concise between than most other manuals. One has to be very keen to get beyond the information in that manual!

The same is true, but less so, for the Vic. The Vic developed out of the PET/COM series of machines and that basic has been very successful over a series of years. When a colour graphics language is developed it makes sense to devote special graphical commands as part of the language and the Basic for the Vic can now make sufficient improvements towards graphical as the lack of high resolution graphics commands.

BBC Basic is, as I have noted, a potentially very powerful language — used to its potential — and though Dragon is

4 Basic is less powerful in some respects, some of the facilities on the Dragon are superior to those on the BBC.

Commands, such as Play or Color (which can also show ellipsis) are very helpful though setting up a long to play for some time is at all 256 different speeds is very tiring on the user.

A rather interesting omission on the Dragon's basic is the lack of a facility for defining user-defined characters (a facility available on all the other three colour computers). David Lawrence (Chapter 5 of *The Working Dragon*) gives routines to overcome the deficiency.

In terms of the loading and saving of the BASIC programs you have written, the Vic and Spectrum come out best — possibly because both are designed for the user novice or possibly a variation in emphasis. The use of cassette recorders on both the Vic and Spectrum is easy, though easier on the Vic than it is on the Spectrum (perhaps with the Vic one has to buy a special Commodore cassette recorder).

On the Dragon and BBC the connection between computer and cassette recorder is by DIN plug connected to the public; this permits to control the cassette recorder from the computer (as is possible with the Vic). The Dragon's commands, sector On and track Off are useful extra facilities on the BBC you have to put out the Remote box.

For somebody such as myself I find the availability of the two pause key and their facility to be highly useful. Their outputs

The Dragon — all right in

on the screen the number of each statement as it is encountered within the program. Again, as a person used to more sophisticated systems, the remember command on Dragon Basic (F12/F13) is very helpful (these are the type of commands normally provided by tools which are not to excess on other computers).

In the case of the Vic and Dragon it is possible to plug in cartridges which run directly when the computer is switched on. The use of cartridges means that the BASIC system is frequently switched on

and other languages can be used with the least difficulty, to load a language and compile into ROM user programs and thus reduces the room available for programs.

On the BBC computer it is possible to insert ROM chips, with its quirks or with such as word processors (but this is rather more tedious and less flexible and does better to feed in here just on paper). The Spectrum has no facility (or the desire) to use ROM-based languages and utilities.

The potential for improvement for the Dragon is greater than the potential of the basic machine in the case of the other three computers. The reason why this is so is that the microprocessor for the Dragon is the Motorola 6809 whereas for the Spectrum is the Zilog Z80 and for the other two is the MOS Technology 6502.

Over a wide range of benchmarks running machine code, the 6809 was up to 11% times faster than the Z80 or 6502 and 640x (Unix Pascal (Pascal Mac Pascal) is a programming language) was only 11% times slower than a Z80 using assembly language (full Mac Pascal 10.3.4).

The Dragon is then a potentially powerful machine if it is possible to use a common language such as Pascal and (only slightly slower) in running than a machine code program on other computers this gives the user great power. It is for example to write a program in an ordinary language such as Basic for Pascal

Wizard Software FOR THE DRAGON 32

SHARK

£7.99

A super break out type game in high resolution graphics. Features include a deformation mode, 100 angles and walls of increasing difficulty from a single wall up to a full three walls. Continuous modes of play, fast, slow and auto (increasing recommended by the Microcomputer Software Club).

ALIENS

£7.99

A machine coded Asteroid game presented in high resolution graphics. Features 40 invasion modes and 4 players per screen, a shield, bonus sheets, continuous display of score during game.

DRAGON SHOOTER

£8.49

A science fiction featuring a 100% galaxy shield control photon torpedo, status reports, highly detailed graphics, launch control, control with three mice keys with moving about three planets and planet based pattern moves where alien life matures, shield fire should docking automatically converging and attacking dragons. Four levels of difficulty comes with instruction manual.

3 Discs required for each machine or game.

MAKE THE MOST OF YOUR DRAGON 32

Two great books to help you tap the power of your Dragon 32.

MAKING THE MOST OF YOUR DRAGON, by Clive Gifford Isaacs, takes you through programming the Dragon from first principles and includes more than 150 complete programs, including major arcade games £5.99.

HYBRIDIC GAMES FOR THE DRAGON 32 — This Martinell and Robert Young. Thirty magnificent games for the Dragon are listed in this 150 page book. To assist your computer before you get you laptop it would be best to buy it. Programs include BASIC CASTLE, SNAKE ATTACK, SPACE RESCUE, REVERS-CHESS, CHECKERS and COOK'S MIKE. £6.99.

Author: Clive Gifford Isaacs. Pub. 0171 444 001 Key Text Books (0800 000 400)
Price £5.99. Please send me the above mentioned
Dynamic Games for the Dragon 32
Making the most of your Dragon

Name _____
Address _____

can) and takes much less programming time so that if the resulting program is to fit that much space there is no need for writing machine code.

When we talk about the basic machine we realise that few computers ever stay as the Basic machine and become extended in many directions. An important point to consider is these the ways in which a computer can be extended.

The computer with the least built-in potential for extension is the Spectrum and that isn't the greatest potential in the BBC Computer (please!) At the moment the computer with the greatest range of peripherals is probably the Vic 20 partly because it has been around for the longest and partly because it was designed to use many of the peripherals available for the PET/C64 series.

Through many private firms have produced items for the Vic 20 owners are encouraged by Commodore to buy Commodore peripherals — starting with the obligatory special cassette recorder. In terms of its other design though the Vic 20 is limited.

Considering that the Spectrum has new power with us for quite a time I think he best one produced to expand its potential by expansion potential. I do not mean the addition of joystick keyboards or sound boards to simplify the Spectrum's tiny case but items such as discs. Most of the expansion of the Spectrum can be seen to go to memory performance in the original Spectrum. Playing a cassette tape keyboard (try to obtain the features of the Vic or Dragon) will bring the price above £200. If you, to increase the size of memory on the Vic to 64k should amount is also going to be expensive.

Moving up

Considering there is for the Spectrum, no games galore, however, for how long will the Spectrum be Sinclair's main machine? Will there be any easy way of gaining compatibility? (I think a TH8-BJ series are very good at offering shared memory etc).

The BBC has the greatest potential because it was so designed but even then there have been problems with the upgrading from BBC Model A to Model B with the so-called "Tube". The BBC computer will be able to use other memory options (such as the 256 or 512K on the BBC2000) as well as others because the BBC was produced before the Spectrum appeared but it only now has discs have become readily available. The BBC is a proper machine designed to be of use for quite a few years, the Sinclair one fails to be intended to have such a long life though some think that the 2001 is a disposable computer (the Sinclair is still as important to have reached that stage how long till the happy end?).

The Dragon is one in a new breed of computer computers which are not designed to be the year's computer but designed to be of longer validity. On those grounds alone of the four machines I could only recommend the BBC2000 as the Dragon for anything which presents to be

increasing memory size on the Vic requires a serious job. So how have I found the Oregon software when I am using it?

I hate computers without an On/Off button. I find something primitive about having to unplug everything or to pull out the jack so I was pleased to discover the button at the rear. I was also pleased to find that my (junkie Acorn computer) I did not have to buy a lead to connect my computer to the cassette recorder. I like the reset button as well as the break key and was glad that when I need the system I did not have to program do it myself by QdOS but has to be done on the BBC 2001 machine and was!

I can get the heading and start typing needed to my keyboard. No lower case poly a can tell us printed output noisy but who really cares? The colour screen isn't a whole and goes, and I wonder if this is anything to do with the fact that the sound comes out of the television speaker. The reason why I wonder this is that the same happens on the television when I use a Vic 20. Vic also sends sound to the television speaker.

The problem is certainly due to me television because I have used Vics which are perfectly perfect on other televisions but they collapse into black and white all the time. The colour of the Spectrum and the BBC is always good on my television and both these have internal speakers (and I do not comment).

Having made my first mistake I have an error message an incomprehensible 1004 of line something or other. Looking at the list of errors I find I have made a syntax error and given time I expect I would be able to decipher most of the error codes in sight, and as there are 24 errors which can be reported I reckon I should reporting as quite good. But what was the error?

I am used to typing in programs where spaces are not significant (as spaces between letters do not matter). Searching through the Dragon manual I could not find where a was explained but it seems that in Dragon blank spaces are sometimes needed and sometimes they are not — my error seemed to be in a P loop. I have quite a long before I realised that this was

what was producing the error and the manual did not help greatly here.

Reading the section on Hot Key loops (p. 54) I came across the interesting line in ROM—memory:

which it was not too clear where these were spaces, and the PG part of the address was printed as '10'.

What the Bloody Interceptor was doing with taking a line PG001—10DM is equivalent to P001—10T with the rest of the line missing. Dragon Basic thinks that the variable PG001 is NT, it ignores all letters when I use first two). This should be made much clearer.

The Dragon is a good company (big the Acorn and the IBM Personal Computer) in being fully about answers if that should be made clear. What makes it more intelligent is that sometimes answers do not make sense!

As a machine the Dragon has great potential but to use that potential the manual should have some explanation of how memory is set out and to find the cut out reference to the four sides called "Additional Information". Even then the information is fairly uninteresting. A useful part is a list of useful locations such as those in the helpful sections of the Spectrum manual, or I have in the Apple II documentation. Often in a bogged down manual found the manual quite helpful (but I am not alone).

Having to edit my syntax error once I had found what I was, I was very excited with the Dragon's Edit command and after some experience with this editor I was very impressed. I was also very impressed by the need for a repeat key.

With the BBC chip racing the best I try other emulators. I am looking forward to trying out languages such as PASCAL which apparently suited to the chips power and capabilities. All in all the Dragon is a machine with potential as well as present attractiveness.

Acknowledgements

I would like to thank MSC Computer Co, Huntingdon, Cambridgeshire (01442 622088) for their help, assistance and advice.

John Symes - A good Dragon program could be inserted in Chip and introduced in America - the market is ripe to consider

THE TWO COMPUTERS that appeared in significant quantities at Christmas the same time it is surprising how different is the state of the software markets for the Sinclair Spectrum and the Dragon 32.

The long established Z80 user base took only a few months to programme with the new machine and began to produce surprising new programs that made full use of its potential.

Despite the well deserved low cost of the computer price and being the one best selling model of the current computer library the software market for the Dragon has been both small and unprofitable.

Many of those who bought their Dragons at Christmas and who are not yet skilled enough to write their own programs were disappointed.

One of the programmers trying to stimulate the software in Wales said: "A 16 Amdahl-based software market without specialists in Dragon software."

Microdeal began as a one-man operation with company director John Symes distributing Tandy Colour computer software from home. He decided to take on a new computer and the Dragon sounded interesting explained John.

It is tempting to suppose that just as Spectrum software could develop naturally from the ZX81 to the Dragon could develop in the similarly unbalanced link between itself and the Tandy as a similar link for Commodore computers according to John. This link is more likely than not clearly a good deal of conviction is required. Ninety nine per cent of the interest in the Tandy colour won't work on the Dragon.

Microdeal fills software gap

Software Editor, Graham Taylor, talks to John Symes of Microdeal, one of the first firms to develop a full range for the Dragon 32.

This is a fact important to John since all of the interests nearly all the games he masters are concern from Tandy catalogues.

Apart from the technical obstacles there are other problems. I certainly see it as a mixture of converting, adapting available for the Tandy or Amstrad into programs for the Dragon over here. There are important differences in the machines.

In a way we're selling an American product in English packages if it's important to remember that American programs are written for American tastes — they don't like complicated adventures for example and are very much more sedate minded.

There is a lot of things like Room packer and programming Spasms that we could adapt from the Tandy but the market isn't interested.

It was again a question of adapting a Tandy program with their fine graphical screen programs. The "Tandywriter" wordprocessor John is very proud of it. Tandywriter is our first new business program. It proves the Dragon isn't just a toy.

Although the Tandywriter looks like being a success, it seemed to me only emphasises the question I implicitly raised at the start: Why didn't we already have a converted American original —

where are all the British Dragon programs?

John shrugged his shoulders. "Well, I've seen none in Britain yet hasn't been good enough. I think it is partly because the British, as a computer progression over here, those who understand machine code have often learnt it in college — that usually means a C64."

John also has part of the blame squarely on Dragon itself. "Dragon has failed in so help whatsoever for any of the software houses, they didn't even tell us they had reconfigured the RAM — it's not we had to withdraw two pages."

"People bought games after playing them in the shop but found they didn't work on their machines at home — naturally they assumed the machine was at fault — it would have cost Dragon a lot of money in unnecessary repairs."

Whatever the initial setbacks Microdeal is now doing well although John was reluctant to go into details. Let's just say we are meeting the market demand.

Microdeal currently has four staff and may take on more to cope with the demand. Up to a month ago it was virtually unknown there before but we're about to get a 24-hour turnaround.

John very keen to stress the

importance he places on speed.

Depends on my data. By now we're packed and ready to go by Saturday. To be honest that's about a game with all the time it takes up but it's necessary until the greater network comes up."

Now that Dragon software is starting to be produced in relatively quantities building up a healthy customer base will be obviously a major objective but it has to be done carefully. We need just just anyone sell our stuff — people have to be able to get the correct back-up advice and information — most programme distributions are copied down.

His concern is the Help Desk manual is developing the dealers should be protected in addition to his accompanying advice towards software users etc. We don't let them have anything — how can the dealers know if we do?

Perhaps a sign that Dragon programmes are finally waking up to the potential the home games machine manufacturers Microdeal is soon to produce its first game from a local programmer — a version of Goldengate's shooting a light gun.

Carefully John hopes it's only the beginning. "If I were chairman I'm paying thousands of dollars in American royalties I'd much prefer to see British programmes getting their big chance."

If anyone has got a decent Dragon program then it's easy just to file something with it.

Remember the whole process might work the other way: a good Dragon program could be exported to Tandy and marketed in America — the royalties could be considerable.

NOW

DRAGON 32 OWNERS

AVAILABLE
NOW

Now you can buy a professional disk system to turn your Dragon into a real computer!

DELTA

△ DELTA GIVES YOU:—

- High speed mass storage of programs and data
- A fully integrated disk operating system included in the controller cartridge
- Available with or without disk drives
- To all standard 8", 5½" and 3" MCDI disk drives
- Full featured file handling included in the DOS
- No modifications required — just plug in and run
- Comprehensive user manual included
- Up to 1.6 Megabytes of storage using 5½" double sided disk drives
- Different drive types supported by one controller cartridge
- Supports up to four double sided drives (most systems only support two)
- Housed in attractive plug-in cartridge
- LOW COST —

△ DELTA SYSTEM 1

Controller inc DOS + 5½" height canon 40 track
disk drive + all cables + comprehensive manual

£299.99 inc VAT

△ DELTA SYSTEM 2

Controller inc DOS + 5½" height canon 40 track
double sided disk drive + all cables + manual

£345.95 inc VAT

△ DELTA CONTROLLER

Controller inc DOS + comprehensive manual

£99.99 inc VAT

PCP Controller only £3.50 Controller + one disk drive £5.50 See for further details

BUY A BRAND NEW DRAGON 32 FROM THE EXPERTS

The leading UK Dragon House, Premier Microsystems, can supply you—right now—with a factory fresh Dragon 32, plus a free cassette lead and 3D Maze program

£199.50 inc VAT + £3.00 p&p

IN ADDITION

Premier Microsystems can **GUARANTEE** you the following:

- 1 Instant delivery of an exciting range of Dragon Software (with more to come!)
- 2 Honest expert advice on your purchases
- 3 The best available technical support to you the customer
- 4 Constant advice & help to all customers through a regular Dragon Newsletter and a Customer Phone-In Evening

QUALITY SOFTWARE

(Available Now!)

PLEASE NOTE: All prices quoted are £100 inc VAT and can become subject to VAT changes.

Landing on the lunar hover pad

David Windle introduces a new game for the Dragon 32 which uses the high level graphics commands to draw the lunar landscape

SUMMER YOU ARE a pilot on an earth mission to Saturn. It is a mission that has gone badly wrong. A line on board the Probe Mother 200 has exploded out of control and it has caused the probe to land on the surface after the crew have managed to get the survivors into the one survivable shuttle which has taken three months to get you back to lunar orbit.

Your problem now is to land the shuttle on the Lunar Pad at Moonbase Alpha. The three-month journey has left you with only 200 units of fuel. Your navigator has got you access millions of space maps detailing the state of the lunar surface. You may find that the low level landing sensor has been damaged. The landing will have to be manual.

You are not sure of the landing speed and have been advised to use the emergency hover pad at Alpha but in the very-colonisation days, this pad holds the ship a few feet above the surface so avoiding damaged stages to off-load passengers and cargo through extending walkways.

On reaching a predetermined height above the pad the ship is locked into position held within a powerful magnetic field.

There is a modulus solar wind blowing your shuttle given range from the pad towards the atmospheric moon ports. If you should run out of fuel you have just one chance if you can hit the eject button at time the survival sequence will start away from the shuttle and you will be back to square one with another 200 units of fuel to use.

If you are not quite enough or miss the pad button well...

Program notes

This program uses the high level graphics to draw the lunar landscape and uses many of the other functions available on the Dragon.

Line 140 draws the shuttle at the foot of the screen.

Line 150 gets it and 300 puts it in position at the start of your descent.

Line 250 uses the present function to detect a crash landing whereas line 370 draws the magnetic field around the pad.

Line 380 displays the warning when it says that the Dragon will only print text in black on green (or vice versa).

Moonbase Alpha was submitted by D. Steele of Nessum Road Hastings in Sussex.

The Dragon Supermarket

One Stop Shopping

One-stop shopping for all your Dragon needs! If you own a Dragon 32 there's now no need to search through endless magazines or visit numerous different suppliers of software packages and peripherals for your Dragon. Just phone call now to a FREEFONE (with no charge required) now - it's "THE DRAGON SUPERMARKET" at ILCA ELECTRONICS exclusive service for all Dragon 32 and Tandy color computer users.

Ask for our free mail order catalogue listing of hard discs, all of the very many products we distribute - games, books, software accessories, etc... and we will be at your service every day.

"THE DRAGON SUPERMARKET" is also distributed from many bookshops with many copies of all the popular magazines we import from the U.S.A.

BONKA FOR DRAGON 32

Amiga, BBC, Amstrad CPC, Sinclair, Amiga, game, using graphics converted for the Dragon 32 and Tandy computers.

Choose up to eleven options for my home made Bonkastyle game (play with two space invaders, alien pogo, big eye, nacho ping and BOOM box) or the bonus. But hurry! If you do it in the next month and half in the new. The dragon 32 Dragon 32 Master and 16K are programmed.

Add to solve your problems, your 240x160x16 colour screen and

PLAYERS INCLUDED

4 different screen formats

Score and 10 game counter displayed on screen. Use of F1/F2 key option switch four separate screens and up to four users so as to make more fun. Many more options for more fun. Dragon 32 and 16K supported.

Getting the most out of graphics

David Lawrence introduces two of the most underused commands in Dragon Basic, *GET* and *PUT*, and shows how the manual got it wrong

LOOKING AT THE programs published in magazines suggests that one area where many Dragon users have not really begun to explore is the use of *GET* and *PUT*. I think this is true in a global sense because in many ways the three two commands which make the Dragon's graphics capabilities stand out from those of other machines on the market.

Other machines have sophisticated line drawing commands like *LINE* to colour in limited areas of the screen, the ability to print the same design at a different angle. But how many have the ability to photograph part or all of their own screen for later use? Using *GET* and *PUT* is as good, if not the only more graphics processor classed that so often bedevil basic programs can be revolutionised.

So why is it, at the moment at least, that *GET* and *PUT* aren't more featured in people's programs? Well, largely, I suspect, it's a lack of the memory that has to be had at the time of the Dragon's manual. Even some Dragon owners who have become used to detecting the inadequacies of the manual will probably not have discovered that when it comes to *GET* and *PUT* the manual is not really inadequate; it is a disaster. With the best will in the world, *GET* and *PUT* are designed to the backbones of programming by its nature. For the simple reason that the amount of memory necessary to use the two commands can be over 99% of system's free memory.

According to the manual, to store a screenshot of 256x256 pixels in the highest resolution mode (*PMODE4*) requires an array of 256x256 or 65536 elements. Since each element in an array requires five bytes of memory, such an array would require some 32000 bytes of memory to store only a relatively small design. To store a whole screen using *GET* would be a total impossibility at either the 256x256 or 480x320 modes, since it would require an array of 1024x768 elements, a total of 786432, making up nearly a quarter of a million bytes of memory.

Listing 1 - a simple program for *GET* and *PUT* that is part of the next page

```

```

free around 6000 bytes of memory left so we can update the screen and then GET it into memory. From then on whenever you need to update the screen you need only PUT the array back on to the screen. While for a simple design this is fairly useful, the difference is greatest in a complex design as discussed and you must then differentiate between an application program and data with all the intricacies of a professional product. Looking I showed you a whole screen can be stored in an array and later replaced on the screen.

On occasions however you may well be pushed by space. The time necessary to set up the design in the first place may take up a considerate amount of memory and it may not be practical to add to that a large array of noise wave files you desire to speed up the process. In this case why not consider setting up the initial design along its on tape separately from the program itself then reading it when the game is played and starting it in use in the game — doing away with the need for all those **OPEN**, **READ** and **PRINT** commands in the main program itself.

Procedure

All that you need to do is to design your
contentful CI pipeline. When it is done in
your application space it is a topic of
Priority on tape using tools such as Jenkins
or CircleCI which can reward to be added
to clustering.

The three numbers in line 100 refer to the beginning of the memory area, the length word, and the number of memory locations. Provided that you are always starting at page one in the video memory, the figures for the various PRG000s would be as follows:

PWIDCP	START	FINISH	SLT%
0	1508	3071	162%
1	1508	4037	307%
2	1508	4037	307%
3	1508	7079	614%
4	1508	7079	614%

If you wish to see video memory starting at any other page but 0 then you must add 1536*page no. 0 to the first two numbers.

You can now add Listing 3 to the main program. It will pick up the essential of graphics from tape 6 so best to store it immediately following the main program on the tape so that there's less fiddling about. All the graphics commands now that we've studied won't fit there though. Don't worry though; this technique allows you to store memory. It is very sufficiently organized when you store the program in your hands, with complex graphics appearing out of nowhere in a program which apparently has no graphics command!

You will note that in these strings, I have selected the C option in the GCT statement, which means simply that the graphic data is packed up into the relevant array. This applies to memory as well as to the memory demands. There is no agreement made and the rule for when C must be included is simple: it must be included if you expect that more

lenses the cameras can give some strange results — what has you can lenses it out is really a matter of trial and error in your particular application.

You can also send the PUT token from the PUT statement and return a sig

The following table shows the increase in space PERT PRESET due to ABS and HST (passenger) factors can all be used as a 100% standard without the

CPT and PHT were not located at their indicated C in the GUT statement. Test this lot partially by removing the C2 from line 180 of Listing 1 and running the program. Never remove the PHT line line 180 and replace the empty line as specified.

statements. In applications involving the whole system or even large sections of it Properly used they represent not only a way to higher speed but a measure to increase in the overall graphics capabilities of the Design compared to a machine which only has such commands as PSET and DRAW. Many users have not discovered this because they have yet to see the real resources of the PSET command set. PSET AND OB are NOT

The contents of these registers are PSET and PRESET. To include PSET or PRESET in the PUT statement, i.e., a PUT (10-110-02) Y0 ALPSET for PRESETID simply places the label before the last line. The cursor will be positioned at the next PSET or PRESET (PRESET).

Anything which was originally made up or its which the design is being placed will be determined by the design contained in the array in exactly the same way that it would if you were generating text in relief, while the two collocation private pool with a specific form of graphics. This Poin is also amend — namely because you can apply directly to the text. Point where the character or design you have listed will be placed on the screen. This Poin is option or for simple moving graphic where the characters do not need to move in front of another and stay on the screen.

Smooth motion

When the character to be used has been defined (possibly using `DEFCHAR`), simply `GCT` a screen area which contains the character and a margin of blank screen on each side. If you intend to move the character, only one `Pixel` is a time and a one `Pixel` block movement is all that's needed. The character can now be moved smoothly around the screen, always continuing its previous position as it moves.

Using Figure 5 as an example of a circle which moves in a straight line along the x -axis but there is no differential principle for more complex movement. Discover the GEDT as one way to solve the T.

will illustrate the difference between the two boxes.

The remaining three options available for PUT really do need to be explained legally since it is not as much their individual capabilities but their interactions which make them so interesting.

WDR This option creates your PUF database problem in a very easy way thanks to the **GWIM** algorithm on the **Genes Spacers**. What it does is to copy everything the designer stored in his account on to another one in the legal area of the service. Thus, the original owner can hardly be not noticing. Unless the designer in the wrong account at the place where he was (or rather, *will be*) before it was placed there.

"The result is a sum of both what was on the paper and what was in the array with any float in the designated position being set to 0.0. Then I have used before the PUT statement, was executed QUIT or was set to 1 in the character stored in the array so we can see it. This can be extremely useful when it is desired to move something through or over what is already present in the process.

PUT: This leaves only Page 1 of the screen. This leaves only Page 1 of the screen which were originally in EBCDIC and whatever was on the screen before the PUT command was executed. ACR is used in the design shared in this entry. If you want to PUT a character on the screen in EBCDIC then PUT a space in the same position using ASCII and you would see no effect because all the chars which are not coincide and that they all result in

If however you were to put a smaller circle inside a larger one they would both disappear completely because they share no corner. Please, kindly add it as it may assist when applying with the next question.

cjNOT That may seem a strange case at first since provided that the array is of sufficient size to cover the screen, what is in the array specified in the PUT statement makes no difference (unless it is what happens on the screen). What does happen is that where the specified rectangle in the screen array has Pixel values previously set to zero (inverted off) and any Pixel that was previously non-zero. The contents of the rectangle are thus inverted. At first sight this might not seem particularly inspiring, but together with AND it enables us to perform a very selective erasure from the screen.

Using 3 illustrations how an measure of one design can be achieved without necessarily blocking out another design with which it would be more pleasant to

Using 7 - gives faster and smoother movement for the cross.

If you notice who run the listing you find that both circles are painted so close to each other that the blank borders of the rectangles containing them actually cover them. They do not make much sense because the second circle is painted over the first.

One of the key areas is crossed when any key is pressed by the printer user or with the AND option of an inverse array which was created as like 1010 by using PUT and NOT and then copied into a second array. When the inverse copy is placed over the original using AND there are no real pixels corresponding. By doing this no the circle is obscured.

However all the blank areas in the original design are replaced by set Pixels in the inverted array so where there is a set Pixel on the screen which is not a part of the design being erased it coincides with a set Pixel in the second (inverted) array and thus is the rules of And it remains set. Unfortunately there are any Pixels covered by the two designs. For instance if the two circles had been placed looking then those pixels are crossed.

More complex.

The problem of creating designs where they actually overlap often is not straight forward. Sometimes it is that the number of Pixels shared by the two designs is so small that their disappearance will make very little difference but this is not always the case. It is then necessary to design the design that you wish to have on the screen.

Listing 8 shows how this technique can be employed to provide a small cross moving along a line of circles. All that happens here is that the circles PUT on in the screen with the OR option so that it appears over my circle in that position. To erase the cross before it moves to the next position, all that is necessary is to PUT the whole line of circles on to the screen again, using PSET which erases the cross. The visual effect is one of motion by the cross along the line of circles and the method can be easily adapted to a variety of applications, especially in games.

Where the design over which you want to move something is changing so that you cannot keep PUTting the same background on to the screen. The solution is to use GET to photograph the area of screen on to which the moving design is about to be placed and rebase the background to that state when the moving design has to be moved.

Listing 9 illustrates how this can be done with the circles and the moving cross and shows that the movement is both faster and smoother than the previous method mentioned.

No doubt at first reading this seems to be overly complicated but had an hour's play with the programs provided will reassure you that GET and PUT does no harm. What may go wrong is a great deal of memory but many of us these only just begin to realize. More than that, they provide a timely reminder that while new modern computers do less than half the memory claim, the good ones are often capable of a lot more.

Getting to grips with handling file procedures

David Lawrence introduces some advantages and pitfalls of learning to use the Dragon's data files

ALMOST ANY serious programming on the Dragon will sooner or later require the use of data files. That is, the saving of bodies of data on tape so that they can be used later, thus avoiding the need to manually re-enter information each time a program is executed.

Data files are also invaluable in developing programs. Since the Dragon initially clears its variables every time a change is made in a program (use a routine to save and release the variables can save time even when the program is being debugged).

At the same time, data files can be one of the most frustrating aspects of Dragon programming for the simple reason that when things go wrong you cannot see what is on the tape to identify the problem. The purpose of this article is to identify some of the major pitfalls in using data files

and to suggest ways of avoiding them. In order to illustrate the methods employed in a specimen case the handling module is included.

One important point before starting to work with data files is to retain the control of the cassette recorder through the service socket.

A positive point

No matter what the benefits when it comes to saving space on a tape, the Dragon's control of its own cassette recorder can be a positive pain when it comes to loading or saving data files while a program is running. Since the user is no longer able to switch the mode on and off at will to position the tape correctly without disturbing the program in its operation.

One solution to the problem is, of course, to leave the control line unplug-

ged. While this is perfectly acceptable when it comes to the writing and saving of programs or during the saving of data it can cause problems when data is being loaded from data files from tape. The reason for that is that in loading data from tape the Dragon will regularly pause to ensure that the data has been read in properly placed in the memory buffer, excepting another track. If the control line is connected then the cassette motor will be switched off during this pause but without the control line the motor continues running and the result can be that some of the data on the tape is missed.

The real solution to the problem is to include in the data file module a routine such as that shown in listing one — it is designed to allow easy positioning of the tape with the motor on and off by clearing the tape delayed through the TV speaker.

```
1000 AUDIO ON: MOTOR ON: PRINT# INPUT "POSITION TAPE THEN PRESS ENTER": MOTOR IS ON
2000 GOSUB: MOTOR OFF
1010 PRINT# INPUT "PLACE RECORDER IN CORRECT MODE THEN PRESS ENTER": GO
1020 PRINT# PRINT "FUNCTIONS AVAILABLE - "
"1>SAVE DATA", "2>LOAD DATA": INPUT "WHICH DO YOU REQUIRE?": GO: ON 9 GOTO 1040: 1100
1030 RETURN
```

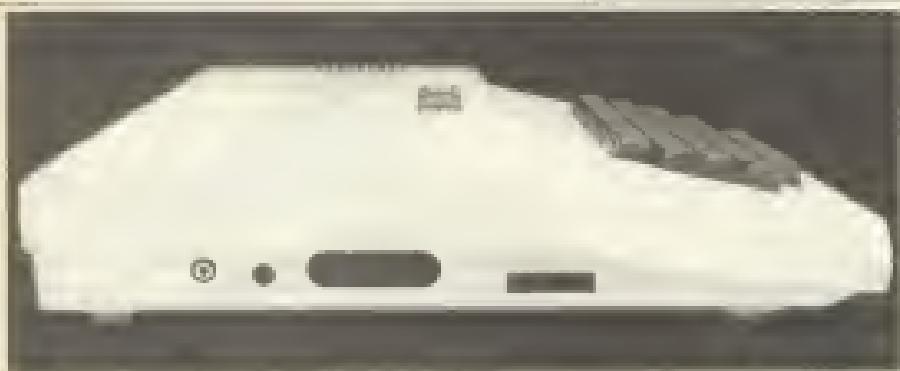

(Using : - designed to allow easy positioning of the tape with the motor on (the : symbol should be used as a :)

```
1040 MOTOR ON: FOR I=1 TO 10000: NEXT I
1050 OPEN"0": E=1: "DATFILE"
1060 PRINTE-1, H1, H2, V1, V2, V3, V4, V1%, V2%
1070 FOR I=2 TO H1-1: PRINTE-1, PCK I >: NEXT
1080 FOR I=0 TO H2: PRINTE-1, PCK I >: NEXT
1090 CLOSEE-1: RETURN
```

(Using : - positioning of header for tape handling line : sign should be used as a :)

```
11000 OPEN"1": E=1: "DATFILE"
1110 INPUTE-1, H1, H2, V1, V2, V3, V4, V1%, V2%
1120 FOR I=0 TO H1-1: INPUTE-1, PCK I >: NEXT
1130 FOR I=0 TO H2: INPUTE-1, PCK I >: NEXT
1140 CLOSEE-1: RETURN
```

(Using : - controlling the settings given in module adequate for reading recorder (DATA option should be used as a :)

One important point before starting to work with data files concerns controlling the cassette recorder through the remote socket between the user friendly back control of the cassette recorder to the Dragon file editor, loading or saving.

Before storing data there is another important point with regard to how reading which is discussed by line 1040 of using `READ` — the position of a header. If you have experimented with storing data on tape then you have probably already discovered that the Dragon is extremely lenient about what is on the tape when it loads files as listed:

If there is an invalid value on the first 10 bytes of recorded remnants of stored previous file immediately before the specified set of data an error is flagged and the program stops. For this reason it is vital to ensure that a clear space is placed before each data line on the tape. The length of the header (as dictated by the size of the load) is a matter of preference but having one so long as that shown has the advantage that if you accidentally begin recording at the very beginning of the tape it will carry you safely over the tape header and no data will be lost.

Having set up your tape correctly the next necessity is to open communication between the Dragon and the cassette recorder (which the Dragon knows under the name of device -1 or # -1 for short). This is done automatically when programs are stored and loaded but with care you have to do it yourself.

The file you open can be one of two types, an output file (line 1050) for saving data to tape or an input file (line 1100) for reading data from tape. The file you actually save must also have a name. If you are saving data from a file it will be saved under that name unless if you are loading data the Dragon will not load a file with a different name.

So what will be stored? In fact anything that can be stored in the Dragon's memory though nothing of it requires some memory. Consideration of the tape record module should show that any numeric variable can indeed a floating-point number (indeed any line giving can be saved or loaded simply by name, using the format `DATA#1` or `INPUT#1`). The main limitation is that you cannot save non-

```
100 PRINT # -1,LEN(AS):FOR I = 1 TO  
LEN(AS) PRINT # -1,ASC(MIDS(AS,I,1))  
NEXT 200 INPUT # -1,L LET AS = "" FOR  
I = 1 TO L READ # -1,CH LET AS = AS  
+CHR$(CH) NEXT
```

Table 1 — how to save a string of graphic characters

blanked characters such as the line registration graphic characters.

Should you wish to save a string of graphic characters — say a string that prints address — you must translate each character into ASCII code, save that number and then on re-loading translate with numeric back into a character. The first specimen lines of table one above have it done.

Loading

Another point of interest is what is not present in listing three the loading routine. According to the Dragon manual it is almost obligatory to make use here of the `EOF` function. This means simply for line 121 this and it is easy at detecting the special marker which denotes the end of the data stored on tape. The importance of this is that if the Dragon attempts to read beyond the end of the file it will encounter unprinted data and probably stop with an error. `EOF` can be used to avoid this by executing the line such as:

```
100 IF EOF# -1 THEN GOTO 200  
... just before each group of items is read from the tape. If the end of the marker is encountered, the program execution can be made to jump out of the module which reads the data. This function can obviously be useful in certain circumstances but in most cases it is unnecessary and can cause programming errors. The reason for this is undoubtedly that in the real memory of programs, the number of items of data of any particular type is not stored but continually overwritten and updated in the logical variables used by the program.
```

In the module physics apart from a few loose variables the program is storing few

sets of items on tape (the two arrays `AS` and `AJ` and the number of items in each set is recorded by the variables `M1` and `M2`. All that is needed is to save `M1` and `M2` first and when the data is packed up from tape the module will know exactly how many items to read in order to skip the whole lot).

The reason I say that this is a better way of saving and loading data is that it will automatically highlight any errors in the way that data is being stored. Either precisely the right amount of data is present or an error is likely to occur. Using `EOF` this can be disregarded since whether or not the correct amount of data is present the loading will terminate successfully at the end of the file.

It is essential to remember that you cannot load data and arrays that haven't been created. That is to say, if you are using loading your programs from tape and then clearing up the data in memory unless either at the start of the program or the routine represented by doing these two commands with `DATA` statements all the arrays that once held the data but which were not saved on tape, it is easily forgotten.

Lastly, when loading or saving a complete file the you have opened must be `CLOSE#1`. The reason for this is that the Dragon can only copy with one file at a time and failure to close the previous one will result in an error being flagged the next time you try to communicate with the cassette recorder.

The three specimen listings contained only one module are easily adaptable for most filing purposes so without more ado you can get down to the task of applying your Dragon to some serious file handling.

Keith Brain explains how to make the most of your printer, from control codes to screen copying

Dragon's printing pleasures

THE DRAGON'S GDF 1000A IS A Remarkable AND QUIET low-cost dot matrix printer with the Dragon type. Centronics parallel interface. It can produce both single and double width characters and also has a dot-addressable graphic printing mode.

Printing mode selection

On power up single-width characters are produced but normal characters, double width characters and graphics can be selected by simply sending the appropriate control code (CHRS/10), CHRS/14) and CHRS/16), respectively in the printer by typing PRACTICE-2 (CHRS/0). The new mode will be held until the countermanded or the power turned off. If you find no characters print out you have probably left it in graphics mode.

Character sets

The GDF 1000A has four alternate character sets available and you need to decide which one to use. The selection is made by means of an internal DIP switch so this is really a software feature. Most of the characters in each set are the same but twelve differ. Two of the sets produce unusual German and Swiss accented symbols and are of little value to the average user. The other choice is between the UK and USA sets, which only differ in that in the UK the hash sign is replaced by the sign for the pound sterling. Certain other useful characters such as various brackets, arrows and Greek symbols are also available via the appropriate character code.

Listing BASIC programs

The best use of a printer is to make programs listings. Typing LIST will print out the current program until the program and its subroutines are printed. The last word of this paper is used (it is reduced and then automatically wrapped round) if you want larger print out change to double width characters before typing the command LIST.

The PRINT-E-2 command outputs ASCII character codes 10 (the printer end) and the effects of punctuation are printed (no carriage return) if you use the command in direct mode then nothing will print until you press

ENTER. If you want to include blank lines on the printer just send the carriage return control code CHRS/13).

Defaulting

The default print start setting is at the left margin of the paper. If you want to move this to the right you need to first indicate that you want to make a change of print position (by sending CHRS/15), [PRACTICE] and then specify how many character units you want to move with the next two bytes this data must be repeated at the start of each line but it is best deal with in a

FOR NEXT loop. Some print formatting can also be achieved by the PRINT-E-2, CLEARD, FORMSET and LSET commands.

The total screen memory runs from 1024 to 1536, and you can easily print what is on the screen. However, if you try to copy the characters on the last screen to the printer by PRINT-E-2 (CHRS/0/0/0/1024-16) you may not get the result you expect, as not all the characters are stored in the screen memory of the Dragon as their ASCII codes.

To convert screen PEEKs to ASCII codes PEEKs between 96 and 128 need to have 64 subtracted, PEEKs between 1 and 255 need 64 added to them. Opcodes to be changed to 00 and PEEKs between 27 and 99 print correctly.

This is not as bad as it sounds as it goes

and a whole screen (960x240) can be produced rapidly by these few bytes:

10 FORM=0/11/1 FORM=STOR
AL-PAPER/200-3-(77/32) FA=00
ANDA-CRTH/THNA=A-040/388/400
ANDA-CRTH/NA=A-061/388/400
THNA=00
20 PRINT=2-CHRS/4) NEXTX
PRINT-E-2 CHRS/1) NEXTX

A copy routine for the hi-resolution screen is invaluable but is a job more complicated to achieve. The Dragon's resolution screen is mapped differently according to the MODE selected but fortunately the coordinate specifications used are the same for all modes.

To see how the display is produced set MODES 1 (Screen 2) and then GLS when you will see a plain screen. If you now HOME 1024 this a dark band will appear at the extreme top left of the screen. If you try pressing similar numbers into 1024 you will find the band changes and breaks up. Pressing 1537 will similarly affect the narrow strip which is to the right of 1536.

The Dragon's resolution mapping system has with each screen point as base cell in the mode, moving from left to right and with the most significant bit on the left, if you PRACTICE 0 0 you will turn on the point in the extreme top left corner of the screen to the same as PRACTICE 1536 to.

The GDF 1000A does not print graphics in an up-and-down fashion, rather than the screen is read and copied the bits in the screen memory. In graphics mode screen cells are addressed by setting bit 1 to 1 in a single byte with bit 0 always set. To convert the screen shape to printout we therefore need to look at screen position 0-0. If bit 0 is set then bit 1 of the first byte is sent to the printer.

Moving down

We now need to move down the Y axis one point to 0 1. If this bit is set then set bit 0 of the next printer byte. This must be repeated until seven bits have been tested and then the eighth bit is set to 1 to complete the first byte.

Fortunately Dragon Basic has PPOINT which actually checks the status of each bit on the screen using the same coordi-

and for all modes) and returns 1 or 0 but we still need to set the pointer back by setting the appropriate numbers to the first byte. The sequence for the first byte is therefore:

```
10 A=PPORT(X,Y)+PPORT  
11 B=1024+PPORT(X,Y+2)  
12 C=PPORT(X,Y+3)+PPORT  
13 D=Y+16+PPORT(X,Y+16)  
14 E=PPORT(X,Y+16)/1024  
PRINTA,B,C,D,E
```

Moving across

Thus you move across the screen one X column at a time which is seven Y rows deep, and when you have collected 256 bytes you need send a carriage return (CHR(13)) and then move down the Y axis of the screen seven lines and then re-collect the next line of graphics points (see the next line of graphics mode registers) left to right; if any of the lines do they will join up neatly.

In the four colour modes bits are set in pairs to indicate the four colours:

First bit Second bit

Red colour	0FF	0FF
Second colour	0FF	0F

Third colour	0F	0FF
--------------	----	-----

Fourth colour	0F	0F
---------------	----	----

and as a consequence of this is that a four colour screen will print out as white, black and left and right-handed cross shades. There are ways around even this problem which allow you to produce more subtle shading, as well as scaling and partial

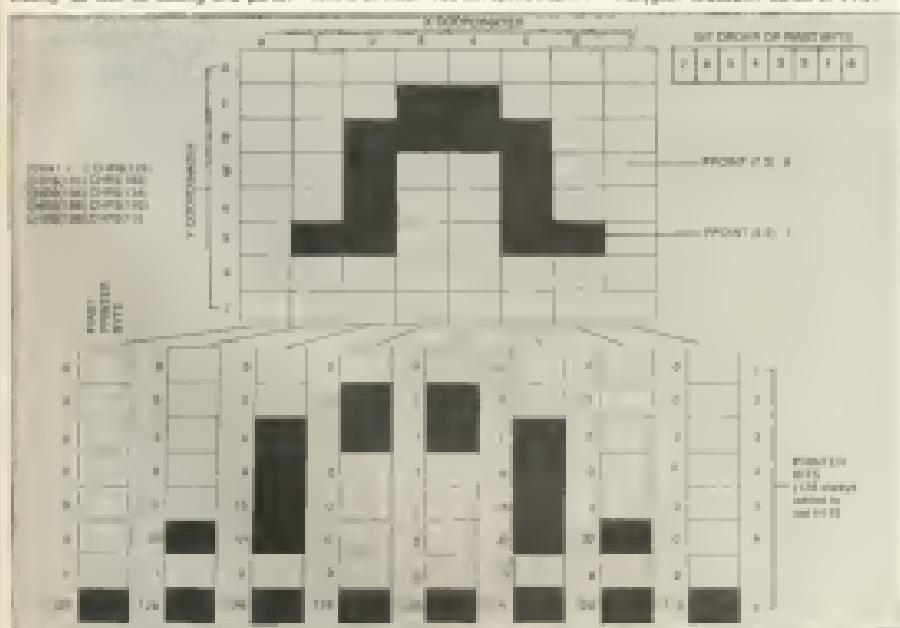

prints, as shown in some of the examples.

It is not necessary to have the screen-panel routines included in a program producing graphics you may want to print. You can store graphics (or even full pages) on tape by using CLASHED and appropriate memory areas according to the PRMODE and then UNCLASH them back for later printing.

Although the screen to print conversion through BASIC is not exactly equivalent it presents us a reasonable rate of speed when producing these files up to 256 graphics items in 16 seconds. You can speed it up with

POKE&PPORT 0 but be sure to remember that you must reset the speed before you can save or load.

A comprehensive BASIC program for printing the Dragon in resolution screen with the Basicline CP1024 is available from the author. The program allows full or partial screen printing in black and white, inverse black and white, and four shades. It also includes a selection of 16 ready-made patterns of how to produce certain shading patterns. It costs £5.95 on cassette or £2.95 on a 3½" disk. Alan Ward's software is Paragon (Glossop, Derbyshire SK14 7UL).

Conversion of a high-resolution (16x16 pixels) to a CP1024 graphics pattern

Send us your Dragon programs, beginning with a general description and explaining how the program is constructed. Take care that the programs are bug-free. We pay £8 for each program published.

Open File

Hex

This program shows the graphics capability of the Dragon and the Tracy colour monitor. Written in mode 2 it is a successful and innovative display can be achieved with the minimum of programming. The game itself is a new version of an old Chinese boardgame.

The instructions are included in the software, but the object of the two-player game will be the first to build a bridge of counters across the hexagonal board when trying to block your opponent by

trapping him/her. The first to do so wins the game (after a game is won the program must break and run again). This program was submitted by D. Owen of Prestwich, Manchester.

1950

As there are 11 rows on the board, CHR(0)-(A) is used for row 11.

1970 As above, B is used for row 12.

1200-1300 The INKEY\$ function finds letter on the keyboard being selected and converts it into a key number.

1320 Computer area being tested in lines 1040 and 1060.

1040-1060 Columns A-K are A-K on screen.

1080-1100 Rows 1-11 (rows A-K on screen).

Program notes

Lines:

60-130	Drawing program by setting up instructions	1320	
140-360	Instructions	1320	
370-400	Set up initial colour of screen and characters	Keys	
410-1040	Draws screen layout	A-K	Rows 1-11 (rows A-K on screen)
1040 & 1060	Test to determine set colour of points (X,Y)	1-	Columns 1-11 (columns 1-11 on screen).

Writing a program to read, edit and record a file is straightforward, but if the same could be done for a programme then Dragon users would be able to reuse their stored storage and expand programs for inclusion in short text editor.

This program shows how to read in programs from an array which can then be manipulated as required.

First you must record the program to be read in ASCII format using Create "name". A. Don't worry about the unusual noise emerging from the Dragon during this operation. Then the following programme will read it into array E\$ as one at each element.

To edit the program just deal with each array element as if it were a string. To save the edited programme just write it to the cassette as if it were a file, or Print -1 PSET(1,1) PSET.

Don't forget to make enough string space available with a Clear. This program was submitted by M. Tegger of West Ham.

Basis of a text editor

```
10 CLEAR 10000
20 DIM E$(200)
30 OPEN "I", -1, "name"
40 I=0
50 IF EOF(-1) THEN 100
60 INPUT -1,E$
70 F$(I)=E$
80 I=I+1
90 GOTO 50
100 CLOSE -1
```

Cruising on Backalley

Before the word of you
Machine Cruising on
Backalley '82 with these
People love to write. Suddenly
a thousand other people write
the Backalley software. Software
that's fun, software that's
exciting and software that's... Backalley
stuff!

Cruising on Backalley is a fun
learning and problem-solving course for
the 16-bit Apple II computer. You type what
you can get the machine to do—
become—each a new adventure,
offering many moments of enjoyment.

2 cassettes & 2 books from Sunshine

The Working Spectrum

Over 100 page book
of software reviews
and programs for various applications
for the Apple II. Includes:
• A complete listing of all the
available software. • Detailed test
reviews of software in education, business,
graphics, games, and utilities. • A
list of all the essential utility
programs and a few games.
Each program is listed with
its author, publisher, and
the cost.

THE WORKING SPECTRUM

The Working Dragon 32

The Working Dragon 32

This is a comprehensive volume to
the Apple II+ Dragon 32 and
includes detailed test reviews
such as "Mail Robot" and a
color Commando and Voltage
game. It also contains tips you will
need to know to make the most
out of your Dragon 32. For the
beginner, it includes high quality
software for learning the Dragon 32
and its peripherals. For the
experienced user, it includes
many programs and utilities
written by professional programmers
and their descriptions of how
they work.

"Without your programs for Backalley
and your review would have been incomplete."

This is a Palms-type game which has been translated from Gredos Basic to Dragon Basic. The program takes up about 28K of RAM.

The object of the game is to eat as many of the power pills - and as many pills! - as possible before the ghost eats you. You can shoot ghosts or go through walls. You can choose between two speeds: fast or slow. This is a perfect test of your skills.

game. If you get lucky or 10-odd points, you can make it.

This program was created to tell you if you have the power or if you will be powerless until you add a job.

The program also has high scores and if you have the highest score it asks for your name. Then at the end of every game and if you win beats your score your name is printed up.

The program uses a Peek to find out if you have fed anything and the same with the ghost.

The program should be bug-free and it

Buyer: Phil and Oregon owners have a good
life. A long time Disney member.

If you are writing a program and you want to find out if it is saved correctly then all you need to do is save your file and then type in `check` which then this checks if the contents is saved correctly.

If you get a NO error then it is not saved correctly. If it is On Cass please rekey it to get back to your program. This does not go over the program in memory — that is if you don't have a program called verify on the tape. This program was submitted by B. Wilson of Berkeley.

Dragonet

This program was devised when playing

around with the Commodore Paint program. A difficulty I had, however, is that the Paint command to prevent Paint from drawing over itself. It is left up to you to decide exactly what it does. This program was written by J.

The title comes from Rochester Kans

Program notes:

Noughts and crosses

This program prints the noughts and crosses grid on the screen and then

invites you to play the game. Start by typing a or o depending on which you are, then by typing a number between 1 and 9. If it's too right, it is because right etc. This program is by C. Davies of Ilfracombe

20-60	Set the red graphics and draw grid
70-190	Determined whether it is a or o
200-600	Determined position of x or o on grid
700-800	Initialised position of x or o on grid
2000-2420	Draw the x's on the screen
2000-2420	Draw the o's on the screen

```

DEALER EXPORT ENQUIRIES WELCOME

If you've got a technical question or problem write to **Clancy Myre**, Dragon Answers, Dragon User, Hatchetway Court, 19 Wharfside Street, London EC2R 7PH.

No joy on joysticks

I HAVE a Dragon 32 and in page 32, 33 and 34 of the manual there is a section using joysticks. It is suggested to fit a basic conversion box into a speech. It costs the joystick to move your cursor and the 16 button to operate your dragon at the other end. But when I press the first button on the left joystick the right joystick is also moved at the same time. I think this is the problem as in lines 100, 102 and 103, it is a procedure that goes long loop in Part 4 of basic dragon:

John White (Age 12)
Aylesbury

IT APPEARS THAT you have an earlier edition of the manual with a mistake on the joystick comments. The joysticks are actually reversed from those given. In line 100, (1) and (1) refer to right joystick and 101, 102, 103 and 104 to the left joystick. The complete method of setting the program as page 32, 33, 34 refers the speech and line buffers. **ANSWER** lines 100, 102, 103 and 104 as below:

100 JSR 100,200 JSR 101
200,201

102 JSR P = 122 JSR P = 252
TBRN P = 1 17-8 001000
200,

103 JSR P = 121 JSR P = 254
TBRN P = 17 1 001000
200,

See PMS002 and also works in conjunction with the processor to switch the RAM.

There is no simple way to write a program which bypasses commands such as LINE and INPUT. You would need a good knowledge of machine code and the BASIC interpreter to avoid this area.

Temporary switching can be brought about by PMS001 to the wrong address, especially in the area of the RAM chip. But as mentioned, damage should be done.

Call for software

MY SON has had a Dragon 32 for several months now but is really disappointed at the quality of software printed in computer magazines. A friend managed to get hold of a magazine called the Phoenix. I would like to know if you could supply me with the name and address of the distributor in this country.

Stu Connolly
Bradley
Worcestershire

The magazine Phoenix is available in the country from Bluebird Software 21 Very New Road, Bredbury, Stockport, Cheshire SK2 9JG. Tel: 061-773 2963.

SAM explained

I WOULD like you could answer the following question I have on computers and programming:
1) What is SAM?
2) Is there any way which I could write a program that can identify specific programmes. like Int and Basic?
3) Is it possible to change the computer by POKING a memory number?

A Person
Grove Moor
Stockport

THE SAM is a Speicheransatz Micros. Which which can read the way in which the main memory works. It is programmed to work in conjunction with the Video Display Generator to con-

Programs disappear

COULD YOU please explain to me why certain things to appear and which lines — even programs — start to disappear on my dragon after a while in the higher memory banks, especially as running a par-

Dragon Answers

PMS001 is used to set to the beginning of the data and access word. The only way to get to any particular bit of data is by reading through all data bytes. It has example to go to the last bit of data and PMS002 will move by PMS = 1 17-8 001000 AS NEXT. This will read the first line we have into A1, move safely, and leave the 10th one there.

Crashing at speed

ON MORE than one occasion you may have found circumstances that the speed of the Dragon 32 goes as increased by PMS 001. On my machine this always causes an immediate program crash. It is necessary to switch off to regain control. When am I doing wrong?

J. Hayton
Bilston

Both Mental
The DRAGON 32 has been designed to work at standard speed and the PMS increased causes it to run at double speed. There may be no fault in the original design specifications and may mean that do not recommend the use of this PMS for the above reasons.

Solution is a loop

I HAVE just a Dragon 32 and for the past few weeks have been trying to write a certain program. It involves the user putting in a number, say five. The computer then adds five + five + five + five + five. If the number was 10 the computer would add 10 + 10 + 10 etc. I haven't had any success in writing the program and hope you can help me out.

Chris Jackson
Middlesbrough

THE PMS OF PROGRAM you require is quite relatively simple using the PMS NEXT line:

10 PMS001 = 1 17-8 001000
20 PMS002 = 1 17-8 001000 AS
30 PMS003 = 1 17-8 001000 AS
40 PMS004 = 1 17-8 001000 AS
50 PMS005 = 1 17-8 001000 AS
60 PMS006 = 1 17-8 001000 AS
70 PMS007 = 1 17-8 001000 AS
80 PMS008 = 1 17-8 001000 AS
90 PMS009 = 1 17-8 001000 AS
100 PMS010 = 1 17-8 001000 AS
110 PMS011 = 1 17-8 001000 AS
120 PMS012 = 1 17-8 001000 AS
130 PMS013 = 1 17-8 001000 AS
140 PMS014 = 1 17-8 001000 AS
150 PMS015 = 1 17-8 001000 AS
160 PMS016 = 1 17-8 001000 AS
170 PMS017 = 1 17-8 001000 AS
180 PMS018 = 1 17-8 001000 AS
190 PMS019 = 1 17-8 001000 AS
200 PMS020 = 1 17-8 001000 AS

Win a printer

ONE OF THE advantages of a computer is its unflagging ability to carry out its tasks. Even when it is running a complex program, say high level chess, the computer is always ready and willing to绎 another game. Similarly, its capacity of repeatedly carrying out simple calculations hundreds or thousands of times, is far superior to when the task is performed by a human operator, where fatigue and distractability lead to errors. No matter how fast the user's computer is, it should be as bright as a lightbulb — or at least as bright as the Sun!

An example of using the computer to run a program involving hundreds of individual calculations, let's consider some mathematical series. A series is a set of numbers, each of which bears a relationship to the preceding terms. Take this simple progression:

$$1 - 10 + 100 - 1000 + 10000 - \dots$$

This can be easily translated into a simple program, and if the program is run and the cumulative total displayed as each successive term is added, it can be seen to be converging towards a specific value. As

the series progresses, the total oscillates towards 0.666117... the natural logarithm of 2. This is one of the ways in which this value can be evaluated empirically.

Other mathematical problems can be similarly solved. This series $1 + 1/2 + 1/3 + 1/4 + \dots$ converges to 2.718281826... the mathematical constant e. The calculation works like factorials. For example, $4! = 1 \times 2 \times 3 \times 4$.

The irrational constant pi, despite its irrational value, can be evaluated by means of a series. Here are just two series which produce pi:

$$\pi = 3\frac{1}{7}$$

$$= 3 + 1/7 + 1/49 + 1/343 + \dots$$

$$= 3 + 1/7 + 1/49 + 1/343 + \dots$$

Note that the numerator and denominator for increased by two, but on alternate steps.

$$\pi = 3\frac{1}{7} + 1/49 + 1/343 + 1/2809 + \dots$$

It seems incredible that so simple a series as this can produce so complex a value as pi.

The series that we have considered so far are *convergent* — that is, they con-

verge to a definite value. Another type of series is called *divergent* — and these increase without limit. For instance the series

$1 + 2 + 3 + 4 + 5 + 6 + 7 + \dots$

will do this increasing to infinity — or in the case of a computer, until the mathematical capacity of the machine is exceeded. Obviously if each successive term gets larger than the series is divergent. Does this mean that all successive terms get smaller? Not necessarily — consider the following:

$$1 + 0.2 + 0.3 + 0.25 + 0.25 + 0.25 + \dots$$

Here although each term gets smaller the series does, in fact, diverge. This can be seen readily if we break the series up into sections. The first three 0.25s add to more than 1.0, i.e. 1.14. Therefore these first terms are greater than 0.3.

Similarly the next four terms, 0.25 + 0.25 + 0.25 + 0.25 are greater than 0.6, i.e. 0.64. This group of four is therefore also greater than 0.3, and the next group of eight terms, the next group of sixteen terms, and so on. We can therefore see that our total must end in greater than

$$1 + 0.2 + 0.3 + 0.25 + 0.25 + 0.25 + \dots$$

Thus it will diverge to infinity — although it will do so very slowly.

The rule of divergence of the series $1 + 1/2 + 1/3 + 1/4 + 1/5 + 1/6 + \dots$

forms the basis of this month's competition.

It can be seen that the total sum exceeds 2 when the fourth term is added ($1 + 1/2 + 1/3 + 1/4$). In order to succeed in the competition the series has to be extended to include the relevant term.

How many terms need to be added for the total to exceed each integer up to 10?

Prizes

THE PRIZE FOR the monthly competition is donated by the software house Microgen. The package offered is one Dragon 32BASIC+1 and a printer for your Dragon, a word processing package and the full range of software from Microgen.

Rules

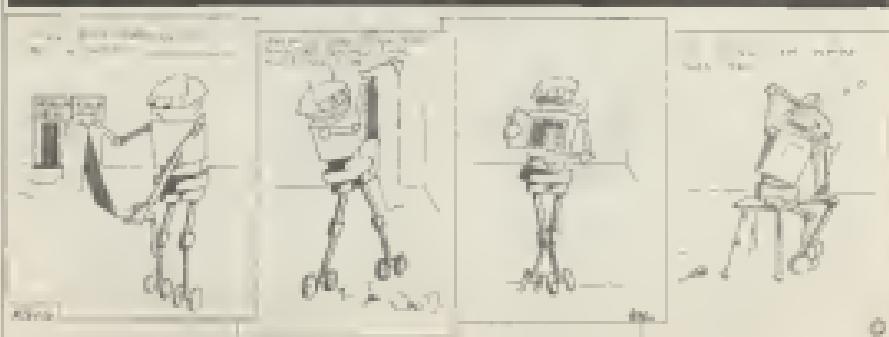

TO WIN THIS software and printer all you have to do is send in the most unusual solution to the puzzle. You must show how the puzzle can be solved with

the use of a basic program developed on your Dragon 32 computer.

As a reminder, complete the sent sentence in 10 words or less:

I will use my Dragon 32 as a word processor because...

Your entry must arrive at Dragon User by the last working day in May 1983. The name of the winner and the solution to the puzzle submitted by the winner will be printed in the July issue of Dragon User. You may only enter the competition once. Entries will not be acknowledged and no entries under 100 words will receive a reply.

Pirate

• 100 •

For children - what do we call the people?

You are the Captain of a Galleon who has to free the sea from Pirates.

You can measure north, south, east, or west up to 4 leagues at a time as you run the course. Replacement of crew members, load etc., can only come from harbours. Navigate to avoid collisions with islands or reefs... and don't fall off the edge of the world.

Take care of your stock of guns, ammunition, oil and men in this action packed high seas adventure with its surprises. Highly Recommended.
